3.1	gooddata_sdk	7
	Python Module Index	179
	Index	181

GoodData Python SDK provides a clean and convenient Python API to interact with GoodData.CN and GoodData Cloud.

At the moment the SDK provides services to inspect and interact with the semantic layer and to consume analytics.

INSTALLATION

1.1 Requirements

- Python 3.7 or newer
- GoodData.CN or GoodData Cloud

1.2 Installation

Run the following command to install the `gooddata-sdk` package on your system:

```
pip install gooddata-sdk
```

1.3 Troubleshooting

- On MacOS, I am getting an error containig following message:

```
(Caused by SSLError(SSLCertVerificationError(1, '[SSL:
CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable to get local
issuer certificate (_ssl.c:1129)'))).
```

This likely caused by Python and it occurs if you have installed Python installed directly from python.org. To mitigate this problem, please install your SSL certificates in *Macintosh HD -> Applications -> Python -> Install Certificates.command**.

SERVICES

All services are accessible by class `gooddata_sdk.GoodDataSdk`. The class forms an entry-point to the SDK.

To create an instance of `GoodDataSdk`:

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# Now you can start calling services.
# For example, get a list of all workspaces from my GoodData.CN project
workspaces = sdk.catalog_workspace.list_workspaces()
```

Supported services:

- Catalog Workspace: Read, update, create and delete workspaces.
 - w entity methods
 - w declarative methods
- Catalog Workspace Content: Read catalog objects (datasets and metrics) from a workspace.
 - wc entity methods
 - wc declarative methods
- Catalog Data Source: Read, update, create and delete data sources and read their tables.
 - ds entity methods
 - ds declarative methods
 - ds action methods
- Catalog User: Read, update, create and delete user and user groups.
 - u entity methods
 - ug entity methods
 - u declarative methods
 - ug declarative methods
 - uug declarative methods

- Catalog Permission: Read, update workspace permissions.
 - p declarative methods
- Catalog Organization: Update organization name, OIDC parameters.
 - o entity methods
- Insights: Read insights stored in a workspace.
 - i entity methods
- Compute: Drives computation of analytics for GoodData.CN workspaces. Used by higher level services such as the Table service.
 - c entity methods
- Table: Compute and read analytics in typical tabular format.
 - t entity methods

API REFERENCE

<i>gooddata_sdk</i>	The <i>gooddata-sdk</i> package aims to provide clean and convenient Python APIs to interact with GoodData.CN.
---------------------	--

3.1 gooddata_sdk

The *gooddata-sdk* package aims to provide clean and convenient Python APIs to interact with GoodData.CN.

At the moment the SDK provides services to inspect and interact with the Semantic Model and consume analytics.

Modules

<i>gooddata_sdk.catalog</i>	
<i>gooddata_sdk.client</i>	Module containing a class that provides access to meta-data and afm services.
<i>gooddata_sdk.compute</i>	
<i>gooddata_sdk.insight</i>	
<i>gooddata_sdk.sdk</i>	
<i>gooddata_sdk.support</i>	
<i>gooddata_sdk.table</i>	
<i>gooddata_sdk.type_converter</i>	
<i>gooddata_sdk.utils</i>	

3.1.1 gooddata_sdk.catalog

Modules

gooddata_sdk.catalog.base

gooddata_sdk.catalog.catalog_service_base

gooddata_sdk.catalog.data_source

gooddata_sdk.catalog.entity

gooddata_sdk.catalog.identifier

gooddata_sdk.catalog.organization

gooddata_sdk.catalog.permission

gooddata_sdk.catalog.types

gooddata_sdk.catalog.user

gooddata_sdk.catalog.workspace

gooddata_sdk.catalog.base

Functions

value_in_allowed(instance, attribute, value)

gooddata_sdk.catalog.base.value_in_allowed

gooddata_sdk.catalog.base.value_in_allowed(*instance: Type[Base], attribute: Attribute, value: str*) →
None

Classes

Base()

gooddata_sdk.catalog.base.Base**class** gooddata_sdk.catalog.base.Base

Bases: object

__init__() → None

Method generated by attrs for class Base.

Methods

<code>__init__()</code>	Method generated by attrs for class Base.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

classmethod `from\_api(entity: Dict[str, Any])` → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from\_dict(data: Dict[str, Any], camel_case: bool = True)` → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.catalog_service_base**Classes**`CatalogServiceBase(api_client)`**gooddata_sdk.catalog.catalog_service_base.CatalogServiceBase**
class gooddata_sdk.catalog.catalog_service_base.CatalogServiceBase(*api_client*:
GoodDataApiClient)

Bases: object

__init__(*api_client*: GoodDataApiClient) → None

Methods

`__init__(api_client)`

`get_organization()`

`layout_organization_folder(layout_root_path)`

Attributes

`organization_id`

`gooddata_sdk.catalog.data_source`

Modules

`gooddata_sdk.catalog.data_source.
action_requests`

`gooddata_sdk.catalog.data_source.
declarative_model`

`gooddata_sdk.catalog.data_source.
entity_model`

`gooddata_sdk.catalog.data_source.service`

`gooddata_sdk.catalog.data_source.
validation`

`gooddata_sdk.catalog.data_source.action_requests`

Modules

`gooddata_sdk.catalog.data_source.
action_requests.ldm_request`

`gooddata_sdk.catalog.data_source.
action_requests.scan_model_request`

`gooddata_sdk.catalog.data_source.action_requests.ldm_request`

Classes

CatalogGenerateLdmRequest(*[, separator, ...])

`gooddata_sdk.catalog.data_source.action_requests.ldm_request.CatalogGenerateLdmRequest`

```
class gooddata_sdk.catalog.data_source.action_requests.ldm_request.CatalogGenerateLdmRequest(*,
    sep: str = '___',
    generate_long_ids: Optional[bool] = None,
    table_prefix: Optional[str] = None,
    view_prefix: Optional[str] = None,
    primary_label_prefix: Optional[str] = None,
    secondary_label_prefix: Optional[str] = None,
    fact_prefix: Optional[str] = None,
    date_granularity: Optional[str] = None,
    grain_prefix: Optional[str] = None,
    reference_prefix: Optional[str] = None,
```

Bases: [Base](#)

```
__init__(*, separator: str = '__', generate_long_ids: Optional[bool] = None, table_prefix: Optional[str] =
None, view_prefix: Optional[str] = None, primary_label_prefix: Optional[str] = None,
secondary_label_prefix: Optional[str] = None, fact_prefix: Optional[str] = None,
date_granularities: Optional[str] = None, grain_prefix: Optional[str] = None, reference_prefix:
Optional[str] = None, grain_reference_prefix: Optional[str] = None, denorm_prefix: Optional[str]
= None, wdf_prefix: Optional[str] = None) → None
```

Method generated by attrs for class CatalogGenerateLdmRequest.

Methods

<code>__init__(*[, separator, generate_long_ids, ...])</code>	Method generated by attrs for class CatalogGenerateLdmRequest.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`separator`

`generate_long_ids`

`table_prefix`

`view_prefix`

`primary_label_prefix`

`secondary_label_prefix`

`fact_prefix`

`date_granularities`

`grain_prefix`

`reference_prefix`

`grain_reference_prefix`

`denorm_prefix`

`wdf_prefix`

classmethod `from_api`(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict`(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.data_source.action_requests.scan_model_request

Functions

`one_scan_true`(instance, *args)

`gooddata_sdk.catalog.data_source.action_requests.scan_model_request.one_scan_true`

`gooddata_sdk.catalog.data_source.action_requests.scan_model_request.one_scan_true`(instance: CatalogScanModelRequest, *args: Any) → None

Classes

`CatalogScanModelRequest`(*[, separator, ...])

`gooddata_sdk.catalog.data_source.action_requests.scan_model_request.CatalogScanModelRequest`

`class gooddata_sdk.catalog.data_source.action_requests.scan_model_request.CatalogScanModelRequest`(*[, separator: str = '__', scan_tables: bool = True, scan_views: bool = False, table_prefix: Optional[str] = None, view_prefix: Optional[str] = None])

Bases: `Base`

`__init__`(*[, separator: str = '__', scan_tables: bool = True, scan_views: bool = False, table_prefix: Optional[str] = None, view_prefix: Optional[str] = None) → None

Method generated by attrs for class `CatalogScanModelRequest`.

Methods

<code>__init__(*[, separator, scan_tables, ...])</code>	Method generated by attrs for class <code>CatalogScan-ModelRequest</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>separator</code>
<code>scan_tables</code>
<code>scan_views</code>
<code>table_prefix</code>
<code>view_prefix</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.data_source.declarative_model`

Modules

<code>gooddata_sdk.catalog.data_source.declarative_model.data_source</code>
<code>gooddata_sdk.catalog.data_source.declarative_model.physical_model</code>

gooddata_sdk.catalog.data_source.declarative_model.data_source

Classes

<i>CatalogDeclarativeDataSource</i> (*, id, type, ...)
<i>CatalogDeclarativeDataSources</i> (*, data_sources)

gooddata_sdk.catalog.data_source.declarative_model.data_source.CatalogDeclarativeDataSource

```
class gooddata_sdk.catalog.data_source.declarative_model.data_source.CatalogDeclarativeDataSource(*,
    id:
    str,
    type:
    str,
    name:
    str,
    url:
    str,
    schema:
    str,
    enable_cache:
    Optional[bool] =
    None,
    pdm:
    Optional[bool] =
    None,
    cache_url:
    Optional[str] =
    None,
    user_name:
    Optional[str] =
    None,
    permissions:
    List[CatalogDeclarativeDataSourcePermission] =
    [])
```

Bases: *Base*

```
__init__(*, id: str, type: str, name: str, url: str, schema: str, enable_caching: Optional[bool] = None, pdm:
Optional[CatalogDeclarativeTables] = None, cache_path: Optional[List[str]] = None, username:
Optional[str] = None, permissions: List[CatalogDeclarativeDataSourcePermission] = []) → None
```

Method generated by attrs for class CatalogDeclarativeDataSource.

Methods

<code>__init__(*, id, type, name, url, schema[, ...])</code>	Method generated by attrs for class CatalogDeclarativeDataSource.
<code>client_class()</code>	
<code>data_source_folder(data_sources_folder, ...)</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(data_sources_folder, ...)</code>	
<code>store_to_disk(data_sources_folder)</code>	
<code>to_api([password, token, ...])</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.
<code>to_test_request([password, token])</code>	

Attributes

<code>id</code>
<code>type</code>
<code>name</code>
<code>url</code>
<code>schema</code>
<code>enable_caching</code>
<code>pdm</code>
<code>cache_path</code>
<code>username</code>
<code>permissions</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.data_source.declarative_model.data_source.CatalogDeclarativeDataSources`

class `gooddata_sdk.catalog.data_source.declarative_model.data_source.CatalogDeclarativeDataSources(*, data_sources: List[CatalogDeclarativeDataSource])`

Bases: `Base`

__init__(* , data_sources: List[CatalogDeclarativeDataSource]) → None

Method generated by attrs for class CatalogDeclarativeDataSources.

Methods

<code>__init__(*, data_sources)</code>	Method generated by attrs for class CatalogDeclarativeDataSources.
<code>client_class()</code>	
<code>data_sources_folder(layout_organization_folder)</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(layout_organization_folder)</code>	
<code>store_to_disk(layout_organization_folder)</code>	
<code>to_api([credentials])</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>data_sources</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.data_source.declarative_model.physical_model

Modules

gooddata_sdk.catalog.data_source.declarative_model.physical_model.column

gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm

gooddata_sdk.catalog.data_source.declarative_model.physical_model.table

gooddata_sdk.catalog.data_source.declarative_model.physical_model.column

Classes

CatalogDeclarativeColumn(*, name, data_type)

gooddata_sdk.catalog.data_source.declarative_model.physical_model.column.CatalogDeclarativeColumn

class gooddata_sdk.catalog.data_source.declarative_model.physical_model.column.CatalogDeclarativeColumn

Bases: *Base*

__init__(**, name: str, data_type: str, is_primary_key: Optional[bool] = None, referenced_table_id: Optional[str] = None, referenced_table_column: Optional[str] = None*) → None

Method generated by attrs for class CatalogDeclarativeColumn.

Methods

__init__ (* <i>, name, data_type[, ...]</i>)	Method generated by attrs for class CatalogDeclarativeColumn.
client_class ()	
from_api (entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict (data[, camel_case])	Creates object from dictionary.
to_api ()	
to_dict ([camel_case])	Converts object into dictionary.

Attributes

name
data_type
is_primary_key
referenced_table_id
referenced_table_column

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm`

Functions

`get_pdm_folder(data_source_folder)`

`gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm.get_pdm_folder`

`gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm.get_pdm_folder`(*data_source_folder*:
Path)
→
Path

Classes

`CatalogDeclarativeTables(*[, tables])`

`CatalogScanResultPdm(*[, pdm, warnings])`

`gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm.CatalogDeclarativeTables`

`class gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm.CatalogDeclarativeTables(*, ta-
ble
List
=
[])`

Bases: `Base`

`__init__(*, tables: List[CatalogDeclarativeTable] = []) → None`

Method generated by attrs for class `CatalogDeclarativeTables`.

Methods

<code>__init__(*[, tables])</code>	Method generated by attrs for class CatalogDeclarativeTables.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(data_source_folder)</code>	
<code>store_to_disk(data_source_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>tables</code>	
---------------------	--

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm.CatalogScanResultPdm

```
class gooddata_sdk.catalog.data_source.declarative_model.physical_model.pdm.CatalogScanResultPdm(*,
    pdm: CatalogDeclarativeTables = CatalogDeclarativeTables(tables=[]), warnings: List[Dict] = [])
```

Bases: *Base*

__init__(*, pdm: CatalogDeclarativeTables = CatalogDeclarativeTables(tables=[]), warnings: List[Dict] = []) → None

Method generated by attrs for class CatalogScanResultPdm.

Methods

__init__ (*[, pdm, warnings])	Method generated by attrs for class CatalogScanResultPdm.
client_class ()	
from_api (entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict (data[, camel_case])	Creates object from dictionary.
to_api ()	
to_dict ([camel_case])	Converts object into dictionary.

Attributes

pdm
warnings

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`
Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]
Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.data_source.declarative_model.physical_model.table`

Classes

`CatalogDeclarativeTable(*, id, type, path, ...)`

`gooddata_sdk.catalog.data_source.declarative_model.physical_model.table.CatalogDeclarativeTable`

class `gooddata_sdk.catalog.data_source.declarative_model.physical_model.table.CatalogDeclarativeTable(*, id: str, type: str, path: List[str], columns: List[CatalogDeclarativeColumn], name_prefix: Optional[str] = None) → None`

Bases: `Base`

__init__(*, id: str, type: str, path: List[str], columns: List[CatalogDeclarativeColumn], name_prefix: Optional[str] = None) → None
Method generated by attrs for class CatalogDeclarativeTable.

Methods

<code>__init__(*, id, type, path, columns[, ...])</code>	Method generated by attrs for class CatalogDeclarativeTable.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(table_file_path)</code>	
<code>store_to_disk(pdm_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>type</code>
<code>path</code>
<code>columns</code>
<code>name_prefix</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict `(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.data_source.entity_model

Modules

<code>gooddata_sdk.catalog.data_source.entity_model.content_objects</code>
<code>gooddata_sdk.catalog.data_source.entity_model.data_source</code>

gooddata_sdk.catalog.data_source.entity_model.content_objects

Modules

<i>gooddata_sdk.catalog.data_source. entity_model.content_objects.table</i>

gooddata_sdk.catalog.data_source.entity_model.content_objects.table

Classes

<i>CatalogDataSourceTable</i> (*, id, type, attributes)

<i>CatalogDataSourceTableAttributes</i> (*, columns)
--

<i>CatalogDataSourceTableColumn</i> (*, name, data_type)

gooddata_sdk.catalog.data_source.entity_model.content_objects.table.CatalogDataSourceTable

class gooddata_sdk.catalog.data_source.entity_model.content_objects.table.CatalogDataSourceTable(*, id: str, type: str, attributes: CatalogDataSourceTableAttributes) → None

Bases: *Base*

__init__(*, id: str, type: str, attributes: CatalogDataSourceTableAttributes) → None
Method generated by attrs for class CatalogDataSourceTable.

Methods

<code>__init__(*, id, type, attributes)</code>	Method generated by attrs for class <code>CatalogData-SourceTable</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>type</code>
<code>attributes</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.data_source.entity_model.content_objects.table.CatalogDataSourceTableAttributes`

`class gooddata_sdk.catalog.data_source.entity_model.content_objects.table.CatalogDataSourceTableAttribu`

Bases: `Base`

`__init__`(* , columns: List[CatalogDataSourceTableColumn], name_prefix: Optional[str] = None, path: Optional[List[str]] = None, type: Optional[str] = None) → None

Method generated by attrs for class CatalogDataSourceTableAttributes.

Methods

<code>__init__</code> (* , columns[, name_prefix, path, type])	Method generated by attrs for class CatalogDataSourceTableAttributes.
<code>client_class</code> ()	
<code>from_api</code> (entity)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (data[, camel_case])	Creates object from dictionary.
<code>to_api</code> ()	
<code>to_dict</code> ([camel_case])	Converts object into dictionary.

Attributes

<code>columns</code>
<code>name_prefix</code>
<code>path</code>
<code>type</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.data_source.entity_model.content_objects.table.CatalogDataSourceTableColumn`

class `gooddata_sdk.catalog.data_source.entity_model.content_objects.table.CatalogDataSourceTableColumn(`

Bases: `Base`

__init__(**, name: str, data_type: str, is_primary_key: Optional[bool] = None, referenced_table_column: Optional[str] = None, referenced_table_id: Optional[str] = None*) → None

Method generated by attrs for class `CatalogDataSourceTableColumn`.

Methods

<code>__init__(*, name, data_type[, ...])</code>	Method generated by attrs for class <code>CatalogData-SourceTableColumn</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>name</code>
<code>data_type</code>
<code>is_primary_key</code>
<code>referenced_table_column</code>
<code>referenced_table_id</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogAssigneeIdentifier

class gooddata_sdk.catalog.identifier.CatalogAssigneeIdentifier(*, id: str, type: str)

Bases: *Base*

__init__(*, id: str, type: str) → None

Method generated by attrs for class CatalogAssigneeIdentifier.

Methods

<code>__init__</code> (*, id, type)	Method generated by attrs for class CatalogAssigneeIdentifier.
<code>client_class</code> ()	
<code>from_api</code> (entity)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (data[, camel_case])	Creates object from dictionary.
<code>to_api</code> ()	
<code>to_dict</code> ([camel_case])	Converts object into dictionary.

Attributes

<code>id</code>
<code>type</code>

classmethod `from_api`(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict`(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogGrainIdentifier

class gooddata_sdk.catalog.identifier.CatalogGrainIdentifier(*, id: str, type: str)

Bases: *Base*

__init__(*, id: str, type: str) → None

Method generated by attrs for class CatalogGrainIdentifier.

Methods

<code>__init__(*, id, type)</code>	Method generated by attrs for class Catalog-GrainIdentifier.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>type</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.identifier.CatalogLabelIdentifier`

class `gooddata_sdk.catalog.identifier.CatalogLabelIdentifier(*, id: str, type: str)`

Bases: `Base`

__init__ `(*, id: str, type: str) → None`

Method generated by attrs for class CatalogLabelIdentifier.

Methods

<code>__init__(*, id, type)</code>	Method generated by attrs for class CatalogLabelIdentifier.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>type</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.identifier.CatalogReferenceIdentifier`

class `gooddata_sdk.catalog.identifier.CatalogReferenceIdentifier(*, id: str)`

Bases: `Base`

__init__(`*, id: str`) → None

Method generated by attrs for class CatalogReferenceIdentifier.

Methods

<code>__init__(*, id)</code>	Method generated by attrs for class <code>CatalogReferenceIdentifier</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>	
-----------------	--

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.identifier.CatalogUserGroupIdentifier`

class `gooddata_sdk.catalog.identifier.CatalogUserGroupIdentifier(*, id: str, type: str)`

Bases: `Base`

`__init__(*, id: str, type: str) → None`

Method generated by attrs for class `CatalogUserGroupIdentifier`.

Methods

<code>__init__(*, id, type)</code>	Method generated by attrs for class <code>CatalogUserGroupIdentifier</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

id

type

classmethod **from_api**(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod **from_dict**(*data: Dict[str, Any], camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogWorkspaceIdentifier

class gooddata_sdk.catalog.identifier.CatalogWorkspaceIdentifier(*, id: str)

Bases: *Base*

__init__(*, id: str) → None

Method generated by attrs for class CatalogWorkspaceIdentifier.

Methods

__init__(*, id)

Method generated by attrs for class CatalogWorkspaceIdentifier.

client_class()

from_api(entity)

Creates object from entity passed by client class, which represents it as dictionary.

from_dict(data[, camel_case])

Creates object from dictionary.

to_api()

to_dict([camel_case])

Converts object into dictionary.

Attributes

id

classmethod **from_api**(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod **from_dict**(*data: Dict[str, Any], camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

Method generated by attrs for class CatalogOrganizationAttributes.

Methods

<code>__init__(*[, name, hostname, ...])</code>	Method generated by attrs for class CatalogOrganizationAttributes.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

name
hostname
allowed_origins
oauth_issuer_location
oauth_client_id

classmethod from_api(*entity: Dict[str, Any]*) → T
Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(*data: Dict[str, Any], camel_case: bool = True*) → T
Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]
Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.organization.entity_model.organization.CatalogOrganizationDocument

class gooddata_sdk.catalog.organization.entity_model.organization.CatalogOrganizationDocument(*, data: CatalogOrganizationDocument) → CatalogOrganizationDocument

Bases: Base

__init__(*, data: CatalogOrganization) → None
Method generated by attrs for class CatalogOrganizationDocument.

Methods

<code>__init__(*, data)</code>	Method generated by attrs for class <code>CatalogOrganizationDocument</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api([oauth_client_secret])</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>data</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.user.entity_model.user.CatalogUserAttributes`

class `gooddata_sdk.catalog.user.entity_model.user.CatalogUserAttributes(*, authentication_id: Optional[str] = None)`

Bases: `Base`

__init__(`*, authentication_id: Optional[str] = None`) → None

Method generated by attrs for class CatalogUserAttributes.

Methods

<code>__init__(*[, authentication_id])</code>	Method generated by attrs for class CatalogUserAttributes.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>authentication_id</code>	
--------------------------------	--

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.user.entity_model.user.CatalogUserDocument`

class `gooddata_sdk.catalog.user.entity_model.user.CatalogUserDocument(*, data: CatalogUser)`

Bases: `Base`

`__init__(*, data: CatalogUser) → None`

Method generated by attrs for class CatalogUserDocument.

Methods

<code>__init__(*, data)</code>	Method generated by attrs for class <code>CatalogUserDocument</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>init(user_id[, authentication_id, ...])</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.
<code>update_user([authentication_id, user_group_ids])</code>	

Attributes

<code>data</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.user.entity_model.user.CatalogUserGroupsData`

class `gooddata_sdk.catalog.user.entity_model.user.CatalogUserGroupsData(*, data: Optional[List[CatalogUserGroup]] = None)`

Bases: `Base`

__init__(*, data: Optional[List[CatalogUserGroup]] = None) → None

Method generated by attrs for class `CatalogUserGroupsData`.

Methods

<code>__init__(*[, data])</code>	Method generated by attrs for class <code>CatalogUserGroupsData</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>get_user_groups</code>
<code>data</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.user.entity_model.user.CatalogUserRelationships`

```
class gooddata_sdk.catalog.user.entity_model.user.CatalogUserRelationships(*, user_groups:
    Optional[CatalogUserGroupsData] = None)
```

Bases: `Base`

__init__(`*, user_groups: Optional[CatalogUserGroupsData] = None`) → None

Method generated by attrs for class `CatalogUserRelationships`.

Methods

<code>__init__(*[, user_groups])</code>	Method generated by attrs for class <code>CatalogUserRelationships</code> .
<code>client_class()</code>	
<code>create_user_relationships(user_group_ids)</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>get_user_groups</code>
<code>user_groups</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.user.entity_model.user_group`

Classes

<code>CatalogUserGroup(*, id[, relationships])</code>
<code>CatalogUserGroupDocument(*, data)</code>
<code>CatalogUserGroupParents(*[, data])</code>
<code>CatalogUserGroupRelationships(*[, parents])</code>

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroup

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroup(*, id: str,
                                                                    relationships: Optional[CatalogUserGroupRelationships],
                                                                    = None)
```

Bases: *Base*

__init__(*, id: str, relationships: Optional[CatalogUserGroupRelationships] = None) → None

Method generated by attrs for class CatalogUserGroup.

Methods

__init__ (*, id[, relationships])	Method generated by attrs for class CatalogUserGroup.
client_class ()	
from_api (entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict (data[, camel_case])	Creates object from dictionary.
init (user_group_id[, user_group_parent_ids])	
to_api ()	
to_dict ([camel_case])	Converts object into dictionary.

Attributes

get_parents
id
relationships

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupDocument

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupDocument(*, data:
                                                    CatalogUserGroup)
```

Bases: *Base*

__init__(*, data: *CatalogUserGroup*) → None

Method generated by attrs for class CatalogUserGroupDocument.

Methods

__init__ (*, data)	Method generated by attrs for class CatalogUserGroupDocument.
client_class ()	
from_api (entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict (data[, camel_case])	Creates object from dictionary.
init (user_group_id[, user_group_parent_ids])	
to_api ()	
to_dict ([camel_case])	Converts object into dictionary.
update_user_group ([user_group_parents_id])	

Attributes

data

classmethod from_api(entity: *Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: *Dict[str, Any]*, camel_case: *bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: *bool = True*) → *Dict[str, Any]*

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupParents

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupParents(*, data: Optional[List[CatalogUserGroupParents]] = None)
```

Bases: *Base*

__init__(*, data: Optional[List[CatalogUserGroupParents]] = None) → None

Method generated by attrs for class CatalogUserGroupParents.

Methods

__init__ (*[, data])	Method generated by attrs for class CatalogUserGroupParents.
client_class ()	
from_api (entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict (data[, camel_case])	Creates object from dictionary.
to_api ()	
to_dict ([camel_case])	Converts object into dictionary.

Attributes

get_parents
data

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupRelationships

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupRelationships(*, parents: Optional[CatalogUserGroupRelationships]] = None)
```

Bases: *Base*

__init__(*[, parents: *Optional[CatalogUserGroupParents]* = None) → None

Method generated by attrs for class CatalogUserGroupRelationships.

Methods

<code>__init__(*[, parents])</code>	Method generated by attrs for class CatalogUserGroupRelationships.
<code>client_class()</code>	
<code>create_user_group_relationships(...)</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>get_parents</code>
<code>parents</code>

classmethod from_api(entity: *Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: *Dict[str, Any]*, camel_case: *bool* = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: *bool* = True) → *Dict[str, Any]*

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogDataSourceTableIdentifier

class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogDataSourceTableIdentifier

Bases: *Base*

__init__(*, id: str, data_source_id: str) → None

Method generated by attrs for class CatalogDataSourceTableIdentifier.

Methods

<code>__init__(*, id, data_source_id)</code>	Method generated by attrs for class <code>CatalogDataSourceTableIdentifier</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>data_source_id</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogDeclarative`

```
class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogD
```

Bases: [Base](#)

```
__init__(*, id: str, title: str, source_column: str, labels: List[CatalogDeclarativeLabel], default_view:
    Optional[CatalogLabelIdentifier] = None, sort_column: Optional[str] = None, sort_direction:
    Optional[str] = None, description: Optional[str] = None, tags: Optional[List[str]] = None) →
    None
```

Method generated by attrs for class CatalogDeclarativeAttribute.

Methods

<code>__init__(*, id, title, source_column, labels)</code>	Method generated by attrs for class CatalogDeclarativeAttribute.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>title</code>
<code>source_column</code>
<code>labels</code>
<code>default_view</code>
<code>sort_column</code>
<code>sort_direction</code>
<code>description</code>
<code>tags</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogDeclarative`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogD`

Bases: [Base](#)

```
__init__(*, id: str, title: str, grain: List[CatalogGrainIdentifier], references:
    List[CatalogDeclarativeReference], description: Optional[str] = None, attributes:
    Optional[List[CatalogDeclarativeAttribute]] = None, facts:
    Optional[List[CatalogDeclarativeFact]] = None, data_source_table_id:
    Optional[CatalogDataSourceTableIdentifier] = None, tags: Optional[List[str]] = None) → None
```

Method generated by attrs for class CatalogDeclarativeDataset.

Methods

<code>__init__(*, id, title, grain, references[, ...])</code>	Method generated by attrs for class CatalogDeclarativeDataset.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(dataset_file)</code>	
<code>store_to_disk(datasets_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>title</code>
<code>grain</code>
<code>references</code>
<code>description</code>
<code>attributes</code>
<code>facts</code>
<code>data_source_table_id</code>
<code>tags</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogDeclarative`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogD`

Bases: *Base*

`__init__`(*, *id*: str, *title*: str, *source_column*: str, *description*: Optional[str] = None, *tags*: Optional[List[str]] = None) → None

Method generated by attrs for class CatalogDeclarativeFact.

Methods

<code>__init__</code> (*, <i>id</i> , <i>title</i> , <i>source_column</i> [, ...])	Method generated by attrs for class CatalogDeclarativeFact.
<code>client_class</code> ()	
<code>from_api</code> (entity)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (data[, <i>camel_case</i>])	Creates object from dictionary.
<code>to_api</code> ()	
<code>to_dict</code> ([<i>camel_case</i>])	Converts object into dictionary.

Attributes

`id`

`title`

`source_column`

`description`

`tags`

classmethod `from_api`(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict`(*data: Dict[str, Any], camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogDeclarative`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogD`

Bases: [Base](#)

```
__init__(*, id: str, title: str, source_column: str, description: Optional[str] = None, tags:
Optional[List[str]] = None, value_type: Optional[str] = None) → None
```

Method generated by attrs for class CatalogDeclarativeLabel.

Methods

<code>__init__(*, id, title, source_column[, ...])</code>	Method generated by attrs for class CatalogDeclarativeLabel.
<code>client_class()</code>	
<code><i>from_api</i>(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code><i>from_dict</i>(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code><i>to_dict</i>([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>title</code>
<code>source_column</code>
<code>description</code>
<code>tags</code>
<code>value_type</code>

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogDeclarative`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogD`

Bases: `Base`

`__init__`(**identifier*: `CatalogReferenceIdentifier`, *multivalue*: `bool`, *source_columns*: `List[str]`) → None
Method generated by attrs for class `CatalogDeclarativeReference`.

Methods

<code>__init__</code> (* <i>identifier</i> , <i>multivalue</i> , ...)	Method generated by attrs for class <code>CatalogDeclarativeReference</code> .
<code>client_class</code> ()	
<code>from_api</code> (<i>entity</i>)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (<i>data</i> [, <i>camel_case</i>])	Creates object from dictionary.
<code>to_api</code> ()	
<code>to_dict</code> ([<i>camel_case</i>])	Converts object into dictionary.

Attributes

<code>identifier</code>
<code>multivalue</code>
<code>source_columns</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

Method generated by attrs for class CatalogDeclarativeDateDataset.

Methods

<code>__init__(*, id, title, ...[, description, tags])</code>	Method generated by attrs for class CatalogDeclarativeDateDataset.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(date_instance_file)</code>	
<code>store_to_disk(date_instances_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>title</code>
<code>granularities_formatting</code>
<code>granularities</code>
<code>description</code>
<code>tags</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict `(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.date_dataset.date_dataset.Catalog`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.date_dataset.date_dataset`

Bases: *Base*

`__init__(*, title_base: str, title_pattern: str) → None`

Method generated by attrs for class `CatalogGranularitiesFormatting`.

Methods

<code>__init__(*, title_base, title_pattern)</code>	Method generated by attrs for class <code>CatalogGranularitiesFormatting</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>title_base</code>
<code>title_pattern</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

<code>store_to_disk(workspaces_folder)</code>	
<code>to_api([include_nested_structures])</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>name</code>
<code>compute_client</code>
<code>model</code>
<code>parent</code>
<code>permissions</code>
<code>hierarchy_permissions</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilter`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilter`

Bases: `Base`

`__init__`(*, *id*: str, *title*: str, *column_name*: str, *workspace_data_filter_settings*: List[CatalogDeclarativeWorkspaceDataFilterSetting], *description*: Optional[str] = None, *workspace*: Optional[CatalogWorkspaceIdentifier] = None) → None

Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilter.

Methods

<code>__init__</code> (*, <i>id</i> , <i>title</i> , <i>column_name</i> , ..., ..., ...)	Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilter.
<code>client_class</code> ()	
<code>from_api</code> (entity)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (data[, <i>camel_case</i>])	param data Data loaded for example from the file.
<code>load_from_disk</code> (workspaces_data_filter_file)	
<code>store_to_disk</code> (workspaces_data_filters_folder)	
<code>to_api</code> ()	
<code>to_dict</code> ([<i>camel_case</i>])	Converts object into dictionary.

Attributes

id
title
column_name
workspace_data_filter_settings
description
workspace

classmethod **from_api**(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod **from_dict**(*data: dict[str, Any], camel_case: bool = True*) → *CatalogDeclarativeWorkspaceDataFilter*

Parameters

- **data** – Data loaded for example from the file.
- **camel_case** – True if the variable names in the input data are serialized names as specified in the OpenAPI document. False if the variables names in the input data are python variable names in PEP-8 snake case.

Returns

CatalogDeclarativeWorkspaceDataFilter object.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilterSetting`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilterSetting`

Bases: `Base`

`__init__`(**id*: *str*, *title*: *str*, *filter_values*: *List[str]*, *workspace*: `CatalogWorkspaceIdentifier`, *description*: *Optional[str]* = *None*) → *None*

Method generated by attrs for class `CatalogDeclarativeWorkspaceDataFilterSetting`.

Methods

<code>__init__</code> (* <i>id</i> , <i>title</i> , <i>filter_values</i> , <i>workspace</i>)	Method generated by attrs for class <code>CatalogDeclarativeWorkspaceDataFilterSetting</code> .
<code>client_class</code> ()	
<code>from_api</code> (<i>entity</i>)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (<i>data</i> [, <i>camel_case</i>])	Creates object from dictionary.
<code>to_api</code> ()	
<code>to_dict</code> ([, <i>camel_case</i>])	Converts object into dictionary.

Attributes

<code>id</code>
<code>title</code>
<code>filter_values</code>
<code>workspace</code>
<code>description</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilter`

`class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilters`

Bases: `Base`

__init__(`*`, `workspace_data_filters: List[CatalogDeclarativeWorkspaceDataFilter]`) → None

Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilters.

Methods

<code>__init__</code> (<code>*</code> , <code>workspace_data_filters</code>)	Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilters.
<code>client_class</code> ()	
<code>from_api</code> (<code>entity</code>)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (<code>data</code> , <code>camel_case</code>)	Creates object from dictionary.
<code>load_from_disk</code> (<code>layout_organization_folder</code>)	
<code>store_to_disk</code> (<code>layout_organization_folder</code>)	
<code>to_api</code> ()	
<code>to_dict</code> (<code>camel_case</code>)	Converts object into dictionary.

Attributes

`workspace_data_filters`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(`camel_case: bool = True`) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceModel

class `gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceModel`

Bases: `Base`

__init__(`*, ldm: Optional[CatalogDeclarativeLdm] = None, analytics: Optional[CatalogDeclarativeAnalyticsLayer] = None`) → None

Method generated by attrs for class CatalogDeclarativeWorkspaceModel.

Methods

<code>__init__(*[, ldm, analytics])</code>	Method generated by attrs for class CatalogDeclarativeWorkspaceModel.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(workspace_folder)</code>	
<code>store_to_disk(workspace_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>ldm</code>
<code>analytics</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict `(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaces`

class `gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaces`

Bases: `Base`

__init__ `(*[, workspaces: List[CatalogDeclarativeWorkspace], workspace_data_filters: List[CatalogDeclarativeWorkspaceDataFilter]) → None`

Method generated by attrs for class CatalogDeclarativeWorkspaces.

Methods

<code>__init__(*, workspaces, workspace_data_filters)</code>	Method generated by attrs for class CatalogDeclarativeWorkspaces.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(layout_organization_folder)</code>	
<code>store_to_disk(layout_organization_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.
<code>workspace_data_filters_folder(...)</code>	
<code>workspaces_folder(layout_organization_folder)</code>	

Attributes

<code>workspaces</code>
<code>workspace_data_filters</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

filter_dataset(*valid_objects: Dict[str, Set[str]]*) → Optional[*CatalogDataset*]

Filters dataset so that it contains only attributes and facts that are part of the provided valid objects structure.

Parameters

valid_objects – mapping of object type to a set of valid object ids

Returns

CatalogDataset containing only valid attributes and facts; None if all of the attributes and facts were filtered out

```

Bases: object

__init__(*valid_obj_fun: functools.partial[dict[str, set[str]]], datasets: list[CatalogDataset], metrics: list[CatalogMetric]*) → None

Methods

__init__ (<i>valid_obj_fun, datasets, metrics</i>)	
catalog_with_valid_objects (<i>ctx</i>)	Returns a new instance of catalog which contains only those datasets (attributes and facts) that are valid in the provided context.
create_workspace_content_catalog (...)	
find_label_attribute (<i>id_obj</i>)	Get attribute by label id.
get_dataset (<i>dataset_id</i>)	Gets dataset by id.
get_metric (<i>metric_id</i>)	Gets metric by id.

Attributes

datasets
metrics

catalog_with_valid_objects(*ctx: Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric, List[Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric]], ExecutionDefinition]*) → *CatalogWorkspaceContent*

Returns a new instance of catalog which contains only those datasets (attributes and facts) that are valid in the provided context. The context is composed of one more more entities of the semantic model and the filtered catalog will contain only those entities that can be safely added on top of that existing context.

Parameters

ctx – existing context. you can specify context in one of the following ways: - single item or list of items from the execution model - single item or list of items from catalog model; catalog fact, label or metric may be added - the entire execution definition that is used to compute analytics

Returns

find_label_attribute(*id_obj: Union[str, ObjId, Dict[str, Dict[str, str]], Dict[str, str]]*) → *Optional[CatalogAttribute]*

Get attribute by label id.

get_dataset(*dataset_id: Union[str, ObjId]*) → *Optional[CatalogDataset]*

Gets dataset by id. The id can be either an instance of *ObjId* or string containing serialized *ObjId* ('dataset/some.dataset.id') or contain just the id part ('some.dataset.id').

Parameters

dataset_id – fully qualified dataset entity id (type/id) or just the identifier of dataset entity

Returns

instance of *CatalogDataset* or None if no such dataset in catalog

:rtype CatalogDataset

get_metric(*metric_id*: Union[str, ObjId]) → Optional[CatalogMetric]

Gets metric by id. The id can be either an instance of ObjId or string containing serialized ObjId ('metric/some.metric.id') or contain just the id part ('some.metric.id').

Parameters

metric_id – fully qualified metric entity id (type/id) or just the identifier of metric entity

Returns

instance of CatalogMetric or None if no such metric in catalog

:rtype CatalogMetric

gooddata_sdk.catalog.workspace.service

Classes

CatalogWorkspaceContentService(api_client)

CatalogWorkspaceService(api_client)

gooddata_sdk.catalog.workspace.service.CatalogWorkspaceContentService

class gooddata_sdk.catalog.workspace.service.CatalogWorkspaceContentService(*api_client*:
GoodDataApiClient)

Bases: *CatalogServiceBase*

__init__(*api_client*: GoodDataApiClient) → None

Methods

<code>__init__(api_client)</code>	
<code>compute_valid_objects(workspace_id, ctx)</code>	Returns attributes, facts, and metrics which are valid to add to a context that already contains some entities from the semantic model.
<code>get_attributes_catalog(workspace_id)</code>	
<code>get_declarative_analytics_model(workspace_id)</code>	
<code>get_declarative_ldm(workspace_id)</code>	
<code>get_facts_catalog(workspace_id)</code>	
<code>get_full_catalog(workspace_id)</code>	Retrieves catalog for a workspace.
<code>get_labels_catalog(workspace_id)</code>	
<code>get_metrics_catalog(workspace_id)</code>	
<code>get_organization()</code>	
<code>layout_organization_folder(layout_root_path)</code>	
<code>layout_workspace_folder(workspace_id, ...)</code>	
<code>load_and_put_declarative_analytics_model(...)</code>	
<code>load_and_put_declarative_ldm(workspace_id[, ...])</code>	
<code>load_declarative_analytics_model(workspace_id)</code>	
<code>load_declarative_ldm(workspace_id[, ...])</code>	
<code>put_declarative_analytics_model(...)</code>	
<code>put_declarative_ldm(workspace_id, ldm[, ...])</code>	
<code>store_declarative_analytics_model(workspace_id)</code>	
<code>store_declarative_ldm(workspace_id[, ...])</code>	

Attributes

organization_id

compute_valid_objects(workspace_id: str, ctx: Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric, List[Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric]], ExecutionDefinition]) → Dict[str, Set[str]]

Returns attributes, facts, and metrics which are valid to add to a context that already contains some entities from the semantic model. The entities are typically used to compute analytics and come from the execution definition. You may, however, specify the entities through different layers of convenience.

Parameters

- **workspace_id** – workspace identifier
- **ctx** – items already in context. you can specify context in one of the following ways: - single item or list of items from the execution model - single item or list of items from catalog model; catalog fact, label or metric may be added - the entire execution definition that is used to compute analytics

Returns

a dict of sets; type of available object is used as key in the dict, the value is a set containing id's of available items

get_full_catalog(workspace_id: str) → *CatalogWorkspaceContent*

Retrieves catalog for a workspace. Catalog contains all data sets and metrics defined in that workspace.

Parameters

workspace_id – workspace identifier

Returns

gooddata_sdk.catalog.workspace.service.CatalogWorkspaceService

class gooddata_sdk.catalog.workspace.service.CatalogWorkspaceService(*api_client*: GoodDataApiClient)

Bases: *CatalogServiceBase*

__init__(*api_client*: GoodDataApiClient) → None

Methods

<code>__init__(api_client)</code>	
<code>create_or_update(workspace)</code>	
<code>delete_workspace(workspace_id)</code>	This method is implemented according to our implementation of delete workspace, which returns HTTP 204 no matter if the workspace_id exists.
<code>get_declarative_workspace(workspace_id)</code>	
<code>get_declarative_workspace_data_filters()</code>	
<code>get_declarative_workspaces()</code>	
<code>get_organization()</code>	
<code>get_workspace(workspace_id)</code>	Gets workspace content and returns it as Catalog-Workspace object.
<code>layout_organization_folder(layout_root_path)</code>	
<code>list_workspaces()</code>	
<code>load_and_put_declarative_workspace_data_filters([...])</code>	
<code>load_and_put_declarative_workspaces([...])</code>	
<code>load_declarative_workspace_data_filters([...])</code>	
<code>load_declarative_workspaces([layout_root_path])</code>	
<code>put_declarative_workspace(workspace_id, ...)</code>	
<code>put_declarative_workspace_data_filters(...)</code>	
<code>put_declarative_workspaces(workspace)</code>	
<code>store_declarative_workspace_data_filters([...])</code>	
<code>store_declarative_workspaces([layout_root_path])</code>	

Attributes

organization_id

delete_workspace(workspace_id: str) → None

This method is implemented according to our implementation of delete workspace, which returns HTTP 204 no matter if the workspace_id exists.

get_workspace(workspace_id: str) → *CatalogWorkspace*

Gets workspace content and returns it as CatalogWorkspace object. :param workspace_id: An input string parameter of workspace id. :return: CatalogWorkspace object containing structure of workspace.

3.1.2 gooddata_sdk.client

Module containing a class that provides access to metadata and afm services.

Classes

<i>GoodDataApiClient</i> (host, token[, ...])	Provide access to metadata and afm services.
---	--

gooddata_sdk.client.GoodDataApiClient

class gooddata_sdk.client.**GoodDataApiClient**(host: str, token: str, custom_headers: Optional[dict[str, str]] = None, extra_user_agent: Optional[str] = None)

Bases: object

Provide access to metadata and afm services.

__init__(host: str, token: str, custom_headers: Optional[dict[str, str]] = None, extra_user_agent: Optional[str] = None) → None

Take url, token for connecting to GoodData.CN.

HTTP requests made by this class may be enriched by *custom_headers* dict containing header names as keys and header values as dict values.

extra_user_agent is optional string to be added to default http User-Agent header. This takes precedence over *custom_headers* setting.

Methods

<i>__init__</i> (host, token[, custom_headers, ...])	Take url, token for connecting to GoodData.CN.
--	--

Attributes

<code>afm_client</code>
<code>metadata_client</code>
<code>scan_client</code>

gooddata_sdk.compute.model.execution

Functions

`compute_model_to_api_model([attributes, ...])`

Transforms categorized execution model entities (attributes, metrics, facts) into an API model that can be used for computations of data results or computations of object availability.

gooddata_sdk.compute.model.execution.compute_model_to_api_model

`gooddata_sdk.compute.model.execution.compute_model_to_api_model(attributes: Optional[list[Attribute]] = None, metrics: Optional[list[Metric]] = None, filters: Optional[list[Filter]] = None) → models.AFM`

Transforms categorized execution model entities (attributes, metrics, facts) into an API model that can be used for computations of data results or computations of object availability.

Parameters

- **attributes** – optionally specify list of attributes
- **metrics** – optionally specify list of metrics
- **filters** – optionally specify list of filters

Returns**Classes**

ExecutionDefinition(attributes, metrics, ...)

dataset

from_date

to_date

gooddata_sdk.compute.model.filter.AllTimeFilter**class** gooddata_sdk.compute.model.filter.AllTimeFilterBases: *Filter*

Filter that is semantically equivalent to absent filter.

This filter exists because ‘All time filter’ retrieved from GoodData.CN is non-standard as it does not have *from* and *to* fields; this is also the reason why *as_api_model* method is not implemented - it would lead to invalid object.

The main feature of this filter is noop.

__init__() → None**Methods****__init__**()*as_api_model*()*is_noop*()**Attributes***apply_on_result***gooddata_sdk.compute.model.filter.AttributeFilter****class** gooddata_sdk.compute.model.filter.AttributeFilter(*label: Union[ObjId, str, Attribute], values: list[str] = None*)Bases: *Filter***__init__**(*label: Union[ObjId, str, Attribute], values: list[str] = None*) → None**Methods****__init__**(*label[, values]*)*as_api_model*()*is_noop*()

```
__init__(local_id, metric, date_attributes)
```

```
as_api_model()
```

Attributes

date_attributes

local_id

metric_local_id

gooddata_sdk.compute.model.metric.PopDatasetMetric

```
class gooddata_sdk.compute.model.metric.PopDatasetMetric(local_id: str, metric: Union[str, Metric],
                                                          date_datasets: list[PopDateDataset])
```

Bases: *Metric*

```
__init__(local_id: str, metric: Union[str, Metric], date_datasets: list[PopDateDataset]) → None
```

Methods

`__init__(local_id, metric, date_datasets)`

`as_api_model()`

Attributes

`date_datasets`

`local_id`

`metric_local_id`

`gooddata_sdk.compute.model.metric.SimpleMetric`

```
class gooddata_sdk.compute.model.metric.SimpleMetric(local_id: str, item: ObjId, aggregation:
Optional[str] = None, compute_ratio: bool =
False, filters: list[Filter] = None)
```

Bases: [Metric](#)

```
__init__(local_id: str, item: ObjId, aggregation: Optional[str] = None, compute_ratio: bool = False,
filters: list[Filter] = None) → None
```

Methods

`__init__(local_id, item[, aggregation, ...])`

`as_api_model()`

Attributes

`aggregation`

`compute_ratio`

`filters`

`item`

`local_id`

gooddata_sdk.compute.service

Classes

<i>ComputeService</i> (api_client)	Compute service drives computation of analytics for a GoodData.CN workspaces.
------------------------------------	---

gooddata_sdk.compute.service.ComputeService

class gooddata_sdk.compute.service.**ComputeService**(api_client: *GoodDataApiClient*)

Bases: object

Compute service drives computation of analytics for a GoodData.CN workspaces. The prescription of what to compute is encapsulated by the *ExecutionDefinition* which consists of attributes, metrics, filters and definition of dimensions that influence how to organize the data in the result.

__init__(api_client: *GoodDataApiClient*)

Methods

__init__(api_client)

<i>for_exec_def</i> (workspace_id, exec_def)	Starts computation in GoodData.CN workspace, using the provided execution definition.
--	---

for_exec_def(workspace_id: str, exec_def: *ExecutionDefinition*) → *ExecutionResponse*

Starts computation in GoodData.CN workspace, using the provided execution definition.

Parameters

- **workspace_id** – workspace identifier
- **exec_def** – execution definition - this prescribes what to calculate, how to place labels and metric values into dimensions

Returns

3.1.4 gooddata_sdk.insight

Classes

<i>Insight</i> (from_vis_obj[, side_loads])	
<i>InsightAttribute</i> (attribute)	
<i>InsightBucket</i> (bucket)	
<i>InsightFilter</i> (f)	
<i>InsightMetric</i> (metric)	Represents metric placed on an insight.
<i>InsightService</i> (api_client)	Insight Service allows retrieval of insights from a GD.CN workspace.

gooddata_sdk.insight.Insight

```
class gooddata_sdk.insight.Insight(from_vis_obj: dict[str, Any], side_loads: Optional[SideLoads] = None)
    Bases: object
    __init__(from_vis_obj: dict[str, Any], side_loads: Optional[SideLoads] = None) → None
```

Methods

<i>__init__</i> (from_vis_obj[, side_loads])
<i>get_metadata</i> (id_obj)

Attributes

are_relations_valid
attributes
buckets
description
filters
id
metrics
properties
side_loads
sorts
title
vis_url

`gooddata_sdk.insight.InsightAttribute`

class `gooddata_sdk.insight.InsightAttribute`(*attribute: dict[str, Any]*)

Bases: `object`

__init__(*attribute: dict[str, Any]*) → `None`

Methods

`__init__(attribute)`

`as_computable()`

Attributes

`alias`

`label`

`label_id`

`local_id`

`gooddata_sdk.insight.InsightBucket`

class `gooddata_sdk.insight.InsightBucket`(*bucket: dict[str, Any]*)

Bases: `object`

`__init__(bucket: dict[str, Any])` → `None`

Methods

`__init__(bucket)`

Attributes

`attributes`

`items`

`local_id`

`metrics`

gooddata_sdk.insight.InsightFilter**class** gooddata_sdk.insight.InsightFilter(*f: dict[str, Any]*)

Bases: object

__init__(*f: dict[str, Any]*) → None**Methods**

__init__(*f*)

as_computable()

gooddata_sdk.insight.InsightMetric**class** gooddata_sdk.insight.InsightMetric(*metric: dict[str, Any]*)

Bases: object

Represents metric placed on an insight.

Note: this has different shape than object passed to execution.

__init__(*metric: dict[str, Any]*) → None**Methods**

__init__(*metric*)

as_computable()

Attributes

alias

format

is_time_comparison

item

item_id

local_id

time_comparison_master

If this is a time comparison metric, return local_id of the master metric from which it is derived.

title

property time_comparison_master: Optional[str]

If this is a time comparison metric, return local_id of the master metric from which it is derived. :return: local_id of master metric, None if not a time comparison metric

gooddata_sdk.insight.InsightService

class gooddata_sdk.insight.InsightService(*api_client*: GoodDataApiClient)

Bases: object

Insight Service allows retrieval of insights from a GD.CN workspace. The insights are returned as instances of Insight which allows convenient introspection and necessary functions to convert the insight into a form where it can be sent for computation.

Note: the insights are created using GD.CN Analytical Designer or using GoodData.UI SDK. They are stored as visualization objects with a free-form body. This body is specific for AD & SDK. The Insight wrapper exists to take care of these discrepancies.

__init__(*api_client*: GoodDataApiClient) → None

Methods

__init__(*api_client*)

get_insight (workspace_id, insight_id)	Gets a single insight from a workspace.
---	---

get_insights (workspace_id)	Gets all insights for a workspace.
------------------------------------	------------------------------------

get_insight(workspace_id: str, insight_id: str) → *Insight*

Gets a single insight from a workspace.

Parameters

- **workspace_id** – identifier of workspace to load insight from
- **insight_id** – identifier of the insight

Returns

single insight; the insight will contain sideloaded metadata about the entities it references

Return type

Insight

get_insights(workspace_id: str) → list[*Insight*]

Gets all insights for a workspace. The insights will contain side loaded metadata for all execution entities that they reference.

Parameters

workspace_id – identifier of workspace to load insights from

Returns

all available insights, each insight will contain side loaded metadata about the entities it references

3.1.5 gooddata_sdk.sdk

Classes

<code>GoodDataSdk</code> (client)	Top-level class that wraps all the functionality together.
-----------------------------------	--

gooddata_sdk.sdk.GoodDataSdk

class gooddata_sdk.sdk.GoodDataSdk(client: GoodDataApiClient)

Bases: object

Top-level class that wraps all the functionality together.

__init__(client: GoodDataApiClient) → None

Take instance of GoodDataApiClient and return new GoodDataSdk instance.

Useful when customized GoodDataApiClient is needed. Usually users should use *GoodDataSdk.create* classmethod.

Methods

<code>__init__</code> (client)	Take instance of GoodDataApiClient and return new GoodDataSdk instance.
<code>create</code> (host_, token_[, extra_user_agent_])	Create common GoodDataApiClient and return new GoodDataSdk instance.

Attributes

catalog_data_source
catalog_organization
catalog_permission
catalog_user
catalog_workspace
catalog_workspace_content
compute
insights
support
tables

```
classmethod create(host_: str, token_: str, extra_user_agent_: Optional[str] = None,
                    **custom_headers_: Optional[str]) → GoodDataSdk
```

Create common GoodDataApiClient and return new GoodDataSdk instance. Custom headers are filtered. Headers with None value are removed. It simplifies usage because headers can be created directly from optional values.

This is preferred way of creating GoodDataSdk, when no tweaks are needed.

3.1.6 gooddata_sdk.support

Classes

SupportService(api_client)

gooddata_sdk.support.SupportService

```
class gooddata_sdk.support.SupportService(api_client: GoodDataApiClient)
```

Bases: object

```
__init__(api_client: GoodDataApiClient) → None
```

Methods

```
__init__(api_client)
```

<i>wait_till_available</i> (timeout[, sleep_time])	Wait till GD.CN service is available. When timeout is:
--	--

Attributes

<i>is_available</i>	Checks if GD.CN is available.
---------------------	-------------------------------

```
property is_available: bool
```

Checks if GD.CN is available. Can raise exceptions in case of authentication or authorization failure.
:return: True - available, False - not available

```
wait_till_available(timeout: int, sleep_time: float = 2.0) → None
```

Wait till GD.CN service is available. When timeout is:

- > 0 exception is raised after given number of seconds.
- = 0 exception is raised whe service is not available immediately
- < 0 no timeout

Method propagates is_available exceptions. :param timeout: seconds to wait to service to be available (see method description for details) :param sleep_time: seconds to wait between GD.CN availability tests

3.1.7 gooddata_sdk.table

Classes

<code>ExecutionTable(response, first_page)</code>	Represents execution result as a table.
<code>TableService(api_client)</code>	The TableService provides a convenient way to drive computations and access the results in a tabular fashion.

gooddata_sdk.table.ExecutionTable

class gooddata_sdk.table.**ExecutionTable**(*response*: [ExecutionResponse](#), *first_page*: [ExecutionResult](#))

Bases: object

Represents execution result as a table. This is a convenience wrapper for executions constructed using the following convention:

- all attributes are in the first dimension
- all metrics are in the second dimension
- if the execution is attribute- or metric-less, then there is always single dimension

The mapping to rows is then as follows:

- both attributes + metrics are on the execution = iteration over first dimension; as many rows as total records in the first dimension (`paging.total[0]`)
- just attributes = iteration over just headers in first dimension; as many rows as total records in the first dimension (`paging.total[0]`)
- just metrics = single row, all metrics values returned in one row

__init__(*response*: [ExecutionResponse](#), *first_page*: [ExecutionResult](#)) → None

Methods

<code>__init__(response, first_page)</code>	
<code>read_all()</code>	Returns a generator that will be yielding execution result as rows.

Attributes

<code>attributes</code>	
<code>column_ids</code>	Returns column identifiers.
<code>column_metadata</code>	Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column.
<code>metrics</code>	

property column_ids: list[str]

Returns column identifiers. Each row will be a mapping of column identifier to column data.

Returns

property column_metadata: dict[str, Union[Attribute, Metric]]

Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column. :return:

read_all() → Generator[dict[str, Any], None, None]

Returns a generator that will be yielding execution result as rows. Each row is a dict() mapping column identifier to value of that column.

Returns

generator yielding dict() representing rows of the table

gooddata_sdk.table.TableService

class gooddata_sdk.table.TableService(*api_client*: GoodDataApiClient)

Bases: object

The TableService provides a convenient way to drive computations and access the results in a tabular fashion.

Compared to the ComputeService, with this one here you do not have to worry about the layout of the result and do not have to have to work with execution response, access the data using paging.

The ExecutionTable returned by the TableService allows you to iterate over the rows of the calculated data.

__init__(*api_client*: GoodDataApiClient) → None

Methods

__init__(*api_client*)

for_insight(*workspace_id*, *insight*)

for_items(*workspace_id*, *items*[, *filters*])

3.1.8 gooddata_sdk.type_converter

Functions

build_stores()

Initialize both AttributeConverterStore and DBTypeConverterStore with Convertors.

gooddata_sdk.type_converter.build_stores

`gooddata_sdk.type_converter.build_stores()` → None

Initialize both `AttributeConverterStore` and `DBTypeConverterStore` with Convertors.

Classes

<code>AttributeConverterStore()</code>	Store for conversion of attributes
<code>Converter()</code>	Base Converter class.
<code>ConverterRegistryStore()</code>	Class store <code>TypeConverterRegistry</code> instances for each registered type.
<code>DBTypeConverterStore()</code>	Store for conversion of database types
<code>DateConverter()</code>	
<code>DatetimeConverter()</code>	
<code>IntegerConverter()</code>	
<code>StringConverter()</code>	
<code>TypeConverterRegistry(type_name)</code>	Class stores converters for given type with ability to distinguish converters based on sub-type granularity.

gooddata_sdk.type_converter.AttributeConverterStore

class `gooddata_sdk.type_converter.AttributeConverterStore`

Bases: `ConverterRegistryStore`

Store for conversion of attributes

`__init__()`

Methods

<code>__init__()</code>	
<code>find_converter(type_name[, sub_type])</code>	Find Converter for given type and sub type.
<code>register(type_name, class_converter[, sub_types])</code>	Register Converter instance created from provided Converter class to given type and list of sub types.
<code>reset()</code>	Reset converters setup

classmethod `find_converter(type_name: str, sub_type: Optional[str] = None) → Converter`

Find Converter for given type and sub type. :param type_name: type name :param sub_type: sub type name

classmethod `register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None`

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type. :param type_name:

type name :param class_converter: Converter class :param sub_types: list of sub types or None (default type Converter)

classmethod reset() → None

Reset converters setup

`gooddata_sdk.type_converter.Converter`

class `gooddata_sdk.type_converter.Converter`

Bases: object

Base Converter class. It defines Converter API and implements support for external type conversion. External type conversion provides ability to plug-in conversion function to Converter

__init__()

Methods

`__init__()`

`db_data_type()`

`set_external_fnc(fnc)`

`to_external_type(value)`

`to_type(value)`

Attributes

`DEFAULT_DB_DATA_TYPE`

`gooddata_sdk.type_converter.ConverterRegistryStore`

class `gooddata_sdk.type_converter.ConverterRegistryStore`

Bases: object

Class store TypeConverterRegistry instances for each registered type. It provides interface to register converters with type and sub-type and to find converter. The class is not meant to be used directly but as base class for child classes

__init__()

Methods

<code>__init__()</code>	
<code>find_converter(type_name[, sub_type])</code>	Find Converter for given type and sub type.
<code>register(type_name, class_converter[, sub_types])</code>	Register Converter instance created from provided Converter class to given type and list of sub types.
<code>reset()</code>	Reset converters setup

classmethod `find_converter(type_name: str, sub_type: Optional[str] = None) → Converter`

Find Converter for given type and sub type. :param type_name: type name :param sub_type: sub type name

classmethod `register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None`

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type. :param type_name: type name :param class_converter: Converter class :param sub_types: list of sub types or None (default type Converter)

classmethod `reset() → None`

Reset converters setup

gooddata_sdk.type_converter.DBTypeConverterStore

class `gooddata_sdk.type_converter.DBTypeConverterStore`

Bases: `ConverterRegistryStore`

Store for conversion of database types

`__init__()`

Methods

<code>__init__()</code>	
<code>find_converter(type_name[, sub_type])</code>	Find Converter for given type and sub type.
<code>register(type_name, class_converter[, sub_types])</code>	Register Converter instance created from provided Converter class to given type and list of sub types.
<code>reset()</code>	Reset converters setup

classmethod `find_converter(type_name: str, sub_type: Optional[str] = None) → Converter`

Find Converter for given type and sub type. :param type_name: type name :param sub_type: sub type name

classmethod `register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None`

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type. :param type_name: type name :param class_converter: Converter class :param sub_types: list of sub types or None (default type Converter)

classmethod `reset()` → None

Reset converters setup

`gooddata_sdk.type_converter.DateConverter`

class `gooddata_sdk.type_converter.DateConverter`

Bases: *Converter*

`__init__()`

Methods

`__init__()`

`db_data_type()`

`set_external_fnc(fnc)`

<code>to_date(value)</code>	Add first month and first date to incomplete iso date string.
-----------------------------	---

`to_external_type(value)`

`to_type(value)`

Attributes

`DEFAULT_DB_DATA_TYPE`

classmethod `to_date(value: str)` → date

Add first month and first date to incomplete iso date string.

```
>>> assert DateConverter.to_date("2021-01") == date(2021, 1, 1)
>>> assert DateConverter.to_date("1992") == date(1992, 1, 1)
```

`gooddata_sdk.type_converter.DatetimeConverter`

class `gooddata_sdk.type_converter.DatetimeConverter`

Bases: *Converter*

`__init__()`

Methods

`__init__()`

`db_data_type()`

`set_external_fnc(fnc)`

`to_datetime(value)` Append minutes to incomplete datetime string.

`to_external_type(value)`

`to_type(value)`

Attributes

`DEFAULT_DB_DATA_TYPE`

classmethod `to_datetime(value: str) → datetime`

Append minutes to incomplete datetime string.

```
>>> from datetime import datetime
>>> assert DatetimeConverter.to_datetime("2021-01-01 02") == datetime(2021, 1, 1, 2, 0)
>>> assert DatetimeConverter.to_datetime("2021-01-01 12:34") == datetime(2021, 1, 1, 12, 34)
```

`gooddata_sdk.type_converter.IntegerConverter`

class `gooddata_sdk.type_converter.IntegerConverter`

Bases: `Converter`

`__init__()`

Methods

`__init__()`

`db_data_type()`

`set_external_fnc(fnc)`

`to_external_type(value)`

`to_type(value)`

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.StringConverter

class gooddata_sdk.type_converter.StringConverter

Bases: *Converter*

__init__()

Methods

__init__()

db_data_type()

set_external_fnc(fnc)

to_external_type(value)

to_type(value)

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.TypeConverterRegistry

class gooddata_sdk.type_converter.TypeConverterRegistry(*type_name: str*)

Bases: object

Class stores converters for given type with ability to distinguish converters based on sub-type granularity.

__init__(*type_name: str*)

Initialize instance with type for which instance is going to be responsible :param type_name: type name

Methods

<code>__init__(type_name)</code>	Initialize instance with type for which instance is going to be responsible :param type_name: type name
<code>converter(sub_type)</code>	Find and return converter instance for a given sub-type.
<code>register(converter, sub_type)</code>	Register converter instance for given sub-type (granularity).

converter(*sub_type: Optional[str]*) → *Converter*

Find and return converter instance for a given sub-type. Default converter instance is returned if the sub-type is not found or not provided. When a default converter is not registered, ValueError exception is raised.
:param sub_type: sub-type name :return: Converter instance

register(*converter: Converter, sub_type: Optional[str]*) → None

Register converter instance for given sub-type (granularity). If sub-type is not specified, converter is registered as the default one for the whole type. Default converter can be registered only once. :param converter: converter instance :param sub_type: sub-type name

3.1.9 gooddata_sdk.utils

Functions

<code>camel_to_snake(camel_case_str)</code>	
<code>change_case(dictionary, case)</code>	
<code>change_case_helper(value, case)</code>	
<code>create_directory(path)</code>	
<code>get_sorted_yaml_files(folder)</code>	
<code>id_obj_to_key(id_obj)</code>	Given an object containing an id+type pair, this function will return a string key.
<code>load_all_entities(get_page_func[, page_size])</code>	Loads all entities from a paged resource.
<code>load_all_entities_dict(get_page_func[, ...])</code>	
<code>read_layout_from_file(path)</code>	
<code>snake_to_camel(snake_case_str)</code>	
<code>write_layout_to_file(path, content)</code>	

gooddata_sdk.utils.camel_to_snake

`gooddata_sdk.utils.camel_to_snake(camel_case_str: str) → str`

gooddata_sdk.utils.change_case

`gooddata_sdk.utils.change_case(dictionary: dict, case: Callable[[str], str]) → dict`

gooddata_sdk.utils.change_case_helper

`gooddata_sdk.utils.change_case_helper(value: Union[list, dict, str], case: Callable[[str], str]) → Union[list, dict, str]`

gooddata_sdk.utils.create_directory

`gooddata_sdk.utils.create_directory(path: Path) → None`

gooddata_sdk.utils.get_sorted_yaml_files

`gooddata_sdk.utils.get_sorted_yaml_files(folder: Path) → list[Path]`

gooddata_sdk.utils.id_obj_to_key

`gooddata_sdk.utils.id_obj_to_key(id_obj: Union[str, ObjId, Dict[str, Dict[str, str]], Dict[str, str]]) → str`

Given an object containing an id+type pair, this function will return a string key.

For convenience, this also recognizes the *ref* format used by GoodData.UI SDK. In that format, the id+type are wrapped in ‘identifier’.

Parameters

id_obj – id object

Returns

string that can be used as key

gooddata_sdk.utils.load_all_entities

`gooddata_sdk.utils.load_all_entities(get_page_func: functools.partial[Any], page_size: int = 500) → AllPagedEntities`

Loads all entities from a paged resource. The primary input to this function is a partial function that is setup with all the fixed parameters. Given this the function will get entities page-by-page and merge them into a single ‘pseudo-response’ containing data and included attributes.

An example usage:

```
>>> import functools
>>> import gooddata_metadata_client as metadata_client
>>> import gooddata_metadata_client.apis as metadata_apis
>>> api = metadata_apis.EntitiesApi(metadata_client.ApiClient())
```

(continues on next page)

(continued from previous page)

```
>>> get_func = functools.partial(api.get_all_entities_visualization_objects, 'some-  
↪workspace-id',  
>>>                                     include=["ALL"], _check_return_type=False)  
>>> vis_objects = load_all_entities(get_func)
```

Parameters

- **get_page_func** – an API controller from the metadata client
- **page_size** – optionally specify page length, default is 500

Returns**gooddata_sdk.utils.load_all_entities_dict**

`gooddata_sdk.utils.load_all_entities_dict`(*get_page_func: functools.partial[Any], page_size: int = 500, camel_case: bool = False*) → dict[str, Any]

gooddata_sdk.utils.read_layout_from_file

`gooddata_sdk.utils.read_layout_from_file`(*path: Path*) → Any

gooddata_sdk.utils.snake_to_camel

`gooddata_sdk.utils.snake_to_camel`(*snake_case_str: str*) → str

gooddata_sdk.utils.write_layout_to_file

`gooddata_sdk.utils.write_layout_to_file`(*path: Path, content: Union[dict[str, Any], list[dict]]*) → None

Classes

AllPagedEntities(data, included)

SideLoads(objs)

gooddata_sdk.utils.AllPagedEntities

class `gooddata_sdk.utils.AllPagedEntities`(*data, included*)

Bases: tuple

`__init__`()

Methods

<code>__init__()</code>	
<code>count(value, /)</code>	Return number of occurrences of value.
<code>index(value[, start, stop])</code>	Return first index of value.

Attributes

<code>data</code>	Alias for field number 0
<code>included</code>	Alias for field number 1

count(*value*, /)

Return number of occurrences of value.

property data

Alias for field number 0

property included

Alias for field number 1

index(*value*, *start*=0, *stop*=9223372036854775807, /)

Return first index of value.

Raises ValueError if the value is not present.

gooddata_sdk.utils.SideLoads

class gooddata_sdk.utils.**SideLoads**(*objs*: list[Any])

Bases: object

__init__(*objs*: list[Any]) → None

Methods

<code>__init__(objs)</code>
<code>all_for_type(obj_type)</code>
<code>find(id_obj)</code>
