
GoodData SDK

Release 1.1.0

GoodData Corporation

Sep 08, 2022

CONTENTS:

1 Installation	3
1.1 Requirements	3
1.2 Installation	3
1.3 Troubleshooting	3
2 Services	5
2.1 Catalog Workspace Service	5
2.2 Catalog Workspace Content Service	10
2.3 Catalog Data Source Service	14
2.4 Catalog User Service	20
2.5 Catalog Permission Service	25
2.6 Catalog Organization Service	26
2.7 Insights Service	27
2.8 Compute Service	28
2.9 Table Service	28
3 API Reference	31
3.1 gooddata_sdk	31
Python Module Index	217
Index	219

GoodData Python SDK provides a clean and convenient Python API to interact with GoodData.CN and GoodData Cloud.

At the moment the SDK provides services to inspect and interact with the semantic layer and to consume analytics.

**CHAPTER
ONE**

INSTALLATION

1.1 Requirements

- Python 3.7 or newer
- GoodData.CN or GoodData Cloud

1.2 Installation

Run the following command to install the `gooddata-sdk` package on your system:

```
pip install gooddata-sdk
```

1.3 Troubleshooting

- On MacOS, I am getting an error containing following message:

```
(Caused by SSLError(SSLCertVerificationError(1, '[SSL:  
CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable to get local  
issuer certificate (_ssl.c:1129)'))).
```

This likely caused by Python and it occurs if you have installed Python installed directly from python.org. To mitigate this problem, please install your SSL certificates in *Macintosh HD -> Applications -> Python -> Install Certificates.command**.

CHAPTER
TWO

SERVICES

All services are accessible by class `gooddata_sdk.GoodDataSdk`. The class forms an entry-point to the SDK.

To create an instance of `GoodDataSdk`:

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# Now you can start calling services.
# For example, get a list of all workspaces from my GoodData.CN project
workspaces = sdk.catalog_workspace.list_workspaces()
```

2.1 Catalog Workspace Service

The `gooddata_sdk.catalog_workspace` service enables you to perform the following actions on workspaces:

- Get and list existing workspaces
- Update or delete existing workspaces
- Create new workspaces
- Store and restore workspaces from directory layout structure

The service supports two types of methods:

- Entity methods let you work with workspaces on a high level using simplified *CatalogWorkspace* entities.
- Declarative methods allow you to work with workspaces on a more granular level by fetching entire workspace layouts, including all of their nested objects.

2.1.1 Entity methods

The `gooddata_sdk.catalog_workspace` supports the following entity API calls:

- `create_or_update(workspace: CatalogWorkspace)`
Create a new workspace or overwrite an existing workspace with the same id.
- `get_workspace(workspace_id: str)`
Returns `CatalogWorkspace`.
Get an individual workspace.
- `delete_workspace(workspace_id: str)`
Delete a workspace with all its content - logical model and analytics model.
- `list_workspaces()`
Returns `List[CatalogWorkspace]`.
Get a list of all existing workspaces.

Example Usage

```
from gooddata_sdk import GoodDataSdk, CatalogWorkspace

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# List workspaces
workspaces = sdk.catalog_workspace.list_workspaces()

print(workspaces)
# [
#   CatalogWorkspace(id=demo, name=Demo),
#   CatalogWorkspace(id=demo_west, name=Demo West),
#   CatalogWorkspace(id=demo_west_california, name=Demo West California)
# ]

# Create new workspace entity locally
my_workspace_object = CatalogWorkspace(workspace_id="test_demo",
                                         name="Test demo",
                                         parent_id="demo")

# Create workspace
sdk.catalog_workspace.create_or_update(workspace=my_workspace_object)

# Edit local workspace entity
my_workspace_object.name = "Test"

# Update workspace
sdk.catalog_workspace.create_or_update(workspace=my_workspace_object)

# Get workspace
```

(continues on next page)

(continued from previous page)

```
workspace = sdk.catalog_workspace.get_workspace(workspace_id="test_demo")

print(workspace)
# CatalogWorkspace(id=test_demo, name=Test)

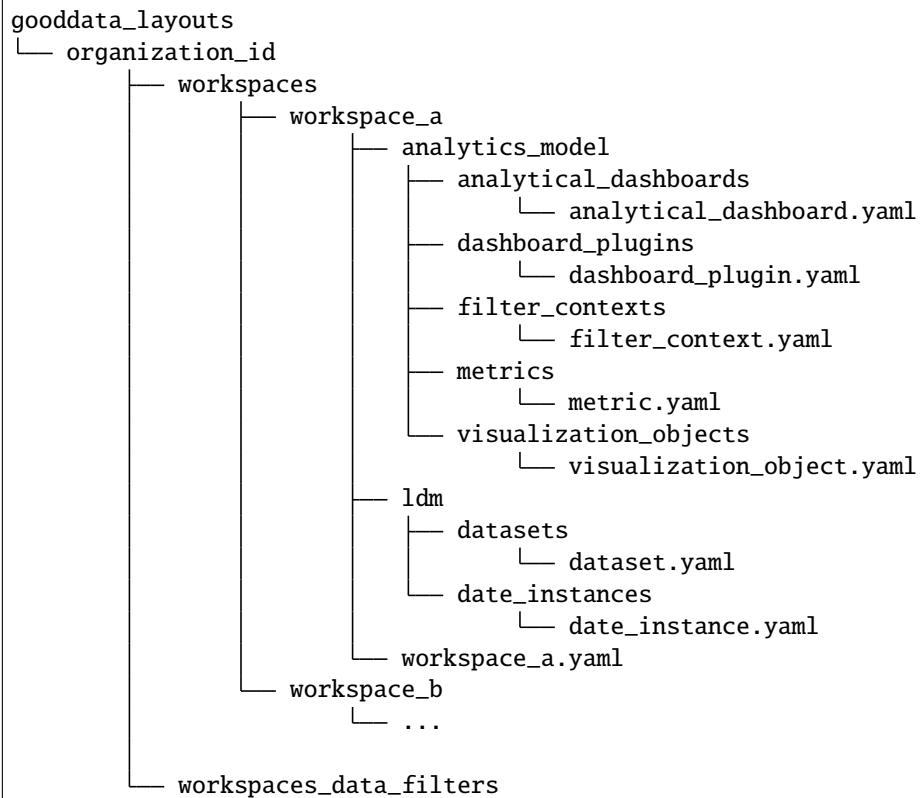

# Delete workspace
sdk.catalog_workspace.delete_workspace(workspace_id="test_demo")
```

2.1.2 Declarative methods

The `gooddata_sdk.catalog_workspace` supports the following declarative API calls:

Workspaces

- `get_declarative_workspaces()`
Returns *CatalogDeclarativeWorkspaces*.
Retrieve layout of all workspaces and their hierarchy.
- `put_declarative_workspaces(workspace: CatalogDeclarativeWorkspaces)`
Set layout of all workspaces and their hierarchy.
- `store_declarative_workspaces(layout_root_path: Path = Path.cwd())`
Store workspaces layouts in directory hierarchy.

(continues on next page)

(continued from previous page)

```

└── filter_1.yaml
└── filter_2.yaml

```

- `load_declarative_workspaces(layout_root_path: Path = Path.cwd())`

Returns *CatalogDeclarativeWorkspaces*.

Load declarative workspaces layout, which was stored using `store_declarative_workspaces`.

- `load_and_put_declarative_workspaces(layout_root_path: Path = Path.cwd())`

This method combines `load_declarative_workspaces` and `put_declarative_workspaces` methods to load and set layouts stored using `store_declarative_workspaces`.

Workspace

- `get_declarative_workspace(workspace_id: str)`

Returns *CatalogDeclarativeWorkspaceModel*.

Retrieve a workspace layout.

- `put_declarative_workspace(workspace_id: str)`

Set a workspace layout.

- `store_declarative_workspace(workspace_id: str, layout_root_path: Path = Path.cwd())`

Store workspace layout in directory hierarchy.

```

gooddata_layouts
└── organization_id
    └── workspaces
        └── workspace_a
            ├── analytics_model
            │   ├── analytical_dashboards
            │   │   └── analytical_dashboard.yaml
            │   ├── dashboard_plugins
            │   │   └── dashboard_plugin.yaml
            │   ├── filter_contexts
            │   │   └── filter_context.yaml
            │   ├── metrics
            │   │   └── metric.yaml
            │   └── visualization_objects
            │       └── visualization_object.yaml
            └── ldm
                ├── datasets
                │   └── dataset.yaml
                └── date_instances
                    └── date_instance.yaml

```

- `load_declarative_workspace(workspace_id: str, layout_root_path: Path = Path.cwd())`

Returns *CatalogDeclarativeWorkspaceModel*.

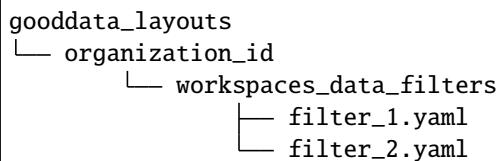

Load declarative workspaces layout, which was stored using `store_declarative_workspace`.

- `load_and_put_declarative_workspace(workspace_id: str, layout_root_path: Path = Path.cwd())`

This method combines `load_declarative_workspace` and `put_declarative_workspace` methods to load and set layouts stored using `store_declarative_workspace`.

Workspace data filters

- `get_declarative_workspace_data_filters()`
Returns `CatalogDeclarativeWorkspaceDataFilters`.
Retrieve a workspace data filter layout.
- `put_declarative_workspace_data_filters(workspace_data_filters: CatalogDeclarativeWorkspaceDataFilters)`
Set a workspace data filter layout.
- `store_declarative_workspace_data_filters(layout_root_path: Path = Path.cwd())`
Store workspace data filters in directory hierarchy.

- `load_declarative_workspace_data_filters(layout_root_path: Path = Path.cwd())`
Returns `CatalogDeclarativeWorkspaceDataFilters`.
Load declarative workspaces layout, which was stored using `store_declarative_workspace_data_filters`.
- `load_and_put_declarative_workspace_data_filters(layout_root_path: Path = Path.cwd())`
This method combines `load_declarative_workspace_data_filters` and `put_declarative_workspace_data_filters` methods to load and set layouts stored using `store_declarative_workspace_data_filters`.

Example Usage

```

from gooddata_sdk import GoodDataSdk
from pathlib import Path

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

backup_path = Path("workspace_hierarchy_backup")

# First create a backup of all workspace layout
sdk.catalog_workspace.store_declarative_workspaces(layout_root_path=backup_path)

# Get workspace layout
workspace_layout = sdk.catalog_workspace.get_declarative_workspace(workspace_id="demo")

```

(continues on next page)

(continued from previous page)

```
# Modify workspace layout
workspace_layout.ldm.datasets[0].description = "This is test"

# Update the workspace layout on the server with your changes
sdk.catalog_workspace.put_declarative_workspace(workspace_id="demo",
                                                workspace=workspace_layout)

# If something goes wrong, use your backup to restore your workspaces from backup
sdk.catalog_workspace.load_and_put_declarative_workspaces(layout_root_path=backup_path)
```

2.2 Catalog Workspace Content Service

The `gooddata_sdk.catalog_workspace_content` service enables you to list catalog all objects from a workspace. These objects include:

- Datasets
- Metrics
- Facts
- Attributes

The service enables read, put, load and store of declarative layout for LDM (logical data model) and analytics model.

The service supports two types of methods:

- Entity methods let you work with workspace content on a high level using simplified entities.
- Declarative methods allow you to work with workspace content on a more granular level by fetching entire workspace content layouts, including all of their nested objects.

2.2.1 Entity methods

The `gooddata_sdk.catalog_workspace_content` supports the following entity API calls:

- `get_full_catalog(workspace_id: str)`
Returns `CatalogWorkspaceContent`.
Retrieve all datasets with attributes, facts, and metrics for a workspace.
- `get_attributes_catalog(workspace_id: str)`
Returns `list[CatalogAttribute]`
Retrieve all attributes for a workspace.
- `get_labels_catalog(workspace_id: str)`
Returns `list[CatalogLabel]`
Retrieve all labels for a workspace.
- `get_metrics_catalog(workspace_id: str)`
Returns `list[CatalogMetric]`
Retrieve all metrics for a workspace.

- `get_facts_catalog(workspace_id: str)`
Returns `list[CatalogFact]`
Retrieve all facts for a workspace.
- `get_dependent_entities_graph(workspace_id: str)`
Returns `CatalogDependentEntitiesResponse`

There are dependencies among all catalog objects, the chain is the following:
fact/attribute/label -> dataset -> metric -> insight -> dashboard

Some steps can be skipped, e.g. fact -> insight
We do not support table -> dataset dependency yet.

- `get_dependent_entities_graph_from_entry_points(workspace_id: str, dependent_entities_request: CatalogDependentEntitiesRequest)`
Returns `CatalogDependentEntitiesResponse`
Extends `get_dependent_entities_graph` with the entry point from which the graph is created.

Example Usage

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

workspace_id = "demo"

# Read catalog for demo workspace
catalog = sdk.catalog_workspace_content.get_full_catalog(workspace_id)

# Print all dataset in the workspace
for dataset in catalog.datasets:
    print(str(dataset))

# Print all metrics in the workspace
for metric in catalog.metrics:
    print(str(metric))

# Read list of attributes for demo workspace
attributes = sdk.catalog_workspace_content.get_attributes_catalog(workspace_id)

# Read list of facts for demo workspace
facts = sdk.catalog_workspace_content.get_facts_catalog(workspace_id)
```

2.2.2 Declarative methods

The `gooddata_sdk.catalog_workspace_content` supports the following declarative API calls:

Logical data model (LDM)

- `get_declarative_ldm(workspace_id: str)`

Returns `CatalogDeclarativeModel`.

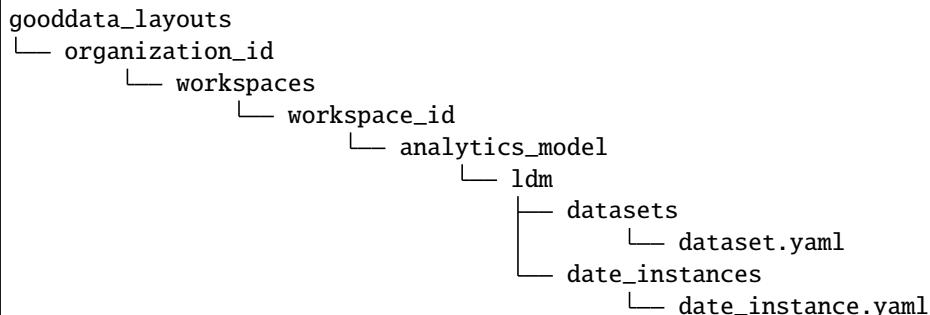

Retrieve a logical model layout. On `CatalogDeclarativeModel` user can call `modify_mapped_data_source(data_source_mapping: dict)` method, which substitutes data source id in datasets.

- `put_declarative_ldm(workspace_id: str, ldm: CatalogDeclarativeModel, validator: Optional[DataSourceValidator])`

Put a logical data model into a given workspace. You can pass an additional validator parameter which checks that for every data source id in the logical data model the corresponding data source exists.

- `store_declarative_ldm(workspace_id: str, layout_root_path: Path = Path.cwd())`

Store logical data model layout in directory hierarchy.

- `load_declarative_ldm(workspace_id: str, layout_root_path: Path = Path.cwd())`

Returns `CatalogDeclarativeModel`.

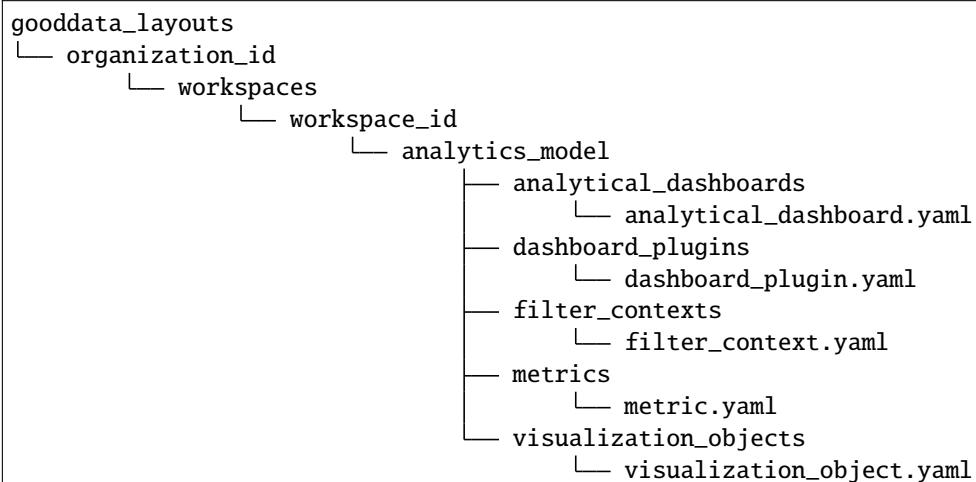

Load declarative LDM layout, which was stored using `store_declarative_ldm`.

- `load_and_put_declarative_ldm(workspace_id: str, layout_root_path: Path = Path.cwd(), validator: Optional[DataSourceValidator])`

This method combines `load_declarative_ldm` and `put_declarative_ldm` methods to load and set layouts stored using `store_declarative_ldm`. You can pass an additional validator parameter which checks that for every data source id in the logical data model the corresponding data source exists.

Analytics Model

- `get_declarative_analytics_model(workspace_id: str)`
Returns *CatalogDeclarativeAnalytics*.
Retrieve an analytics model layout.
- `put_declarative_analytics_model(workspace_id: str, analytics_model: CatalogDeclarativeAnalytics)`
Put an analytics model into a given workspace.
- `store_declarative_analytics_model(workspace_id: str, layout_root_path: Path = Path.cwd())`
Store declarative analytics model layout in directory hierarchy.

- `load_declarative_analytics_model(workspace_id: str, layout_root_path: Path = Path.cwd())`
Returns *CatalogDeclarativeAnalytics*.
Load declarative LDM layout, which was stored using `store_declarative_analytics_model`.
- `load_and_put_declarative_analytics_model(workspace_id: str, layout_root_path: Path = Path.cwd())`
This method combines `load_declarative_analytics_model` and `put_declarative_analytics_model` methods to load and set layouts stored using `store_declarative_analytics_model`.

Example usage:

```

from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

workspace_id = "demo"

```

(continues on next page)

(continued from previous page)

```

# Get ldm object afterward you can modify it
ldm = sdk.catalog_workspace_content.get_declarative_ldm(workspace_id=workspace_id)

# Modify data source id for datasets
ldm.modify_mapped_data_source({"demo-test-ds": "demo-prod-ds"})

# Put ldm object back to server
sdk.catalog_workspace_content.put_declarative_ldm(workspace_id=workspace_id, ldm=ldm)

# Get analytics model object afterward you can modify it
analytics_model = sdk.catalog_workspace_content.get_declarative_analytics_
model(workspace_id=workspace_id)

# Put analytics model object back to server
sdk.catalog_workspace_content.put_declarative_analytics_model(workspace_id=workspace_id,
                                                               analytics_model=analytics_
model)

```

2.3 Catalog Data Source Service

The `gooddata_sdk.catalog_data_source` service enables you to manage data sources and list their tables. Data source object represents your database, which you integrate with GoodData.CN.

Generally there are two ways how to register data sources:

- The default way works for all data source types: You specify jdbc url, data source type and relevant credentials.
- Customized way for each of the different data source types. You specify custom attributes relevant for your data source and data source type and the url is set in background.

The service supports three types of methods:

- Entity methods let you work with data sources on a high level using simplified *CatalogDataSource* entities.
- Declarative methods allow you to work with data sources on a more granular level by fetching entire workspace layouts, including all of their nested objects.
- Action methods let you perform an execution of some form of computation.

2.3.1 Entity methods

The `gooddata_sdk.catalog_data_source` supports the following entity API calls:

- `create_or_update_data_source(data_source: CatalogDataSource)`
Create or update data source.
- `get_data_source(data_source_id: str)`
Returns *CatalogDataSource*.
Retrieve data source using data source id.
- `delete_data_source(data_source_id: str)`
Delete data source using data source id.

- `patch_data_source_attributes(data_source_id: str, attributes: dict)`
Allows you to apply changes to the given data source.
- `list_data_sources()`
Returns *List[CatalogDataSource]*.
Lists all data sources.
- `list_data_source_tables(data_source_id: str)`
Returns *List[CatalogDataSourceTable]*
Lists all tables for a data source specified by id.

Example Usage

```

from gooddata_sdk import GoodDataSdk
from gooddata_sdk import (
    CatalogDataSource,
    BasicCredentials,
    CatalogDataSourcePostgres,
    PostgresAttributes,
    CatalogDataSourceSnowflake,
    SnowflakeAttributes,
    CatalogDataSourceBigQuery,
    BigQueryAttributes,
    TokenCredentialsFromFile
)

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# Create (or update) data source using general interface - can be used for any type of
# data source
# If data source already exists, it is updated
sdk.catalog_data_source.create_or_update_data_source(
    CatalogDataSource(
        id="test",
        name="Test2",
        data_source_type="POSTGRESQL",
        url="jdbc:postgresql://localhost:5432/demo",
        schema="demo",
        credentials=BasicCredentials(
            username="demouser",
            password="demopass",
        ),
        enable_caching=False,
        url_params=[("param", "value")]
    )
)

# Use Postgres specific interface

```

(continues on next page)

(continued from previous page)

```

sdk.catalog_data_source.create_or_update_data_source(
    CatalogDataSourcePostgres(
        id="test",
        name="Test2",
        db_specific_attributes=PostgresAttributes(
            host="localhost", db_name="demo"
        ),
        schema="demo",
        credentials=BasicCredentials(
            username="demouser",
            password="demopass",
        ),
        enable_caching=False,
        url_params=[("param", "value")]
    )
)

# Create Snowflake data source using specialized interface
sdk.catalog_data_source.create_or_update_data_source(
    CatalogDataSourceSnowflake(
        id="test",
        name="Test2",
        db_specific_attributes=SnowflakeAttributes(
            account="mycompany", warehouse="MYWAREHOUSE", db_name="MYDATABASE"
        ),
        schema="demo",
        credentials=BasicCredentials(
            username="demouser",
            password="demopass",
        ),
        enable_caching=False,
        url_params=[("param", "value")]
    )
)

# BigQuery requires path to credentials file, where service account definition is stored
sdk.catalog_data_source.create_or_update_data_source(
    CatalogDataSourceBigQuery(
        id="test",
        name="Test",
        db_specific_attributes=BigQueryAttributes(
            project_id="project_id"
        ),
        schema="demo",
        credentials=TokenCredentialsFromFile(
            file_path=Path("credentials") / "bigquery_service_account.json"
        ),
        enable_caching=True,
        cache_path=["cache_schema"],
        url_params=[("param", "value")]
    )
)

```

(continues on next page)

(continued from previous page)

```
# Look for other CatalogDataSource classes to find your data source type

# List data sources
data_sources = sdk.catalog_data_source.list_data_sources()

# Get single data source
data_sources = sdk.catalog_data_source.get_data_source(data_source_id='test')

# Patch data source attribute(s)
sdk.catalog_data_source.patch_data_source_attributes(data_source_id="test",
                                                      attributes={"name": "Name2"})

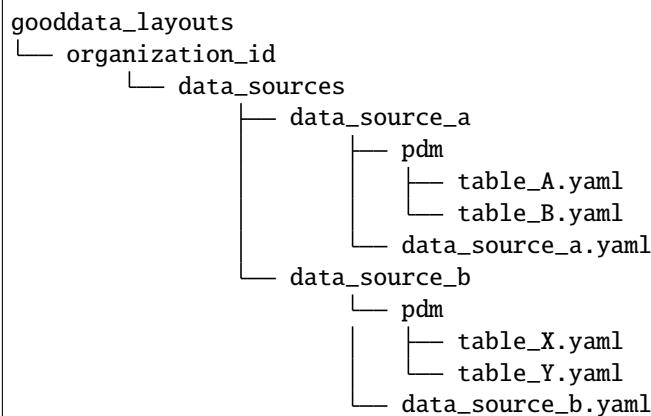

# Delete data source
sdk.catalog_data_source.delete_data_source(data_source_id='test')
```

2.3.2 Declarative methods

The `gooddata_sdk.catalog_data_source` supports the following declarative API calls:

Data sources

- `get_declarative_data_sources()`
Returns `CatalogDeclarativeDataSources`.
Retrieve all data sources, including their related physical model.
- `put_declarative_data_sources(declarative_data_sources: CatalogDeclarativeDataSources, credentials_path: Optional[Path] = None, test_data_sources: bool = False)`
Set all data sources, including their related physical model.
- `store_declarative_data_sources(layout_root_path: Path = Path.cwd())`
Store data sources layouts in directory hierarchy.

- `load_declarative_data_sources(layout_root_path: Path = Path.cwd())`

Returns *CatalogDeclarativeDataSources*.

Load declarative data sources layout, which was stored using *store_declarative_data_sources*.

- `load_and_put_declarative_data_sources(layout_root_path: Path = Path.cwd(), credentials_path: Optional[Path] = None, test_data_sources: bool = False)`

This method combines *load_declarative_data_sources* and *put_declarative_data_sources* methods to load and set layouts stored using *store_declarative_data_sources*.

Physical data model (PDM)

- `get_declarative_pdm(data_source_id: str)`

Returns *CatalogDeclarativeTables*.

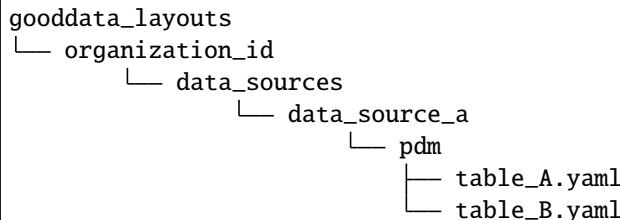

Retrieve physical model for a given data source.

- `put_declarative_pdm(data_source_id: str, declarative_tables: CatalogDeclarativeTables)`

Set physical model for a given data source.

- `store_declarative_pdm(data_source_id: str, layout_root_path: Path = Path.cwd())`

Store physical model layout in directory hierarchy for a given data source.

- `load_declarative_pdm(data_source_id: str, layout_root_path: Path = Path.cwd())`

Returns *CatalogDeclarativeTables*.

Load declarative physical model layout, which was stored using *store_declarative_pdm* for a given data source.

- `load_and_put_declarative_pdm(self, data_source_id: str, layout_root_path: Path = Path.cwd())`

This method combines *load_declarative_pdm* and *put_declarative_pdm* methods to load and set layouts stored using *store_declarative_pdm*.

Example usage:

```
from gooddata_sdk import GoodDataSdk
from pathlib import Path

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# Get all data sources
```

(continues on next page)

(continued from previous page)

```
ds_objects = sdk.catalog_data_source.get_declarative_data_sources()

print(ds_objects.data_sources[0])
# CatalogDeclarativeDataSource(id=demo-test-ds, type=POSTGRESQL)

# Put data sources with credentials and test data source connection before put
sdk.catalog_data_source.put_declarative_data_sources(declarative_data_sources=ds_objects,
                                                    credentials_path=Path("credentials"),
                                                    test_data_sources=True)
```

2.3.3 Action methods

The `gooddata_sdk.catalog_data_source` supports the following action API calls:

- `generate_logical_model(data_source_id: str, generate_ldm_request: CatalogGenerateLdmRequest)`
 - Returns *CatalogDeclarativeModel*.
 - Generate logical data model for a data source.
- `register_upload_notification(data_source_id: str)`
 - Invalidate cache of your computed reports to force your analytics to be recomputed.
- `scan_data_source(data_source_id: str, scan_request: CatalogScanModelRequest = CatalogScanModelRequest(), report_warnings: bool = False)`
 - Returns *CatalogScanResultPdm*.
 - Scan data source specified by its id and optionally by specified scan request. *CatalogScanResultPdm* contains PDM and warnings. Warnings contain information about columns which were not added to the PDM because their data types are not supported. Additional parameter `report_warnings` can be passed to suppress or to report warnings. By default warnings are returned but not reported to STDOUT. If you set `report_warnings` to True, warnings are reported to STDOUT.
- `scan_and_put_pdm(data_source_id: str, scan_request: CatalogScanModelRequest = CatalogScanModelRequest())`
 - This method combines `scan_data_source` and `put_declarative_pdm` methods.
- `scan_schemata(data_source_id: str)`
 - Returns *list[str]*.
 - Returns a list of schemas that exist in the database and can be configured in the data source entity. Data source managers like Dremio or Drill can work with multiple schemas and schema names can be injected into `scan_request` to filter out tables stored in the different schemas.
- `test_data_sources_connection(declarative_data_sources: CatalogDeclarativeDataSources, credentials_path: Optional[Path] = None)`
 - Tests connection to declarative data sources. If `credentials_path` is omitted then the connection is tested with empty credentials. In case some connection failed the `ValueError` is raised with information about why the connection to the data source failed, e.g. host unreachable or invalid login or password”.

Example of credentials YAML file:

::

```
data_sources:  
    demo-test-ds: "demopass" demo-bigquery-ds: "~/home/secrets.json"
```

Example usage:

```
from gooddata_sdk import GoodDataSdk, CatalogGenerateLdmRequest  
  
# GoodData.CN host in the form of uri eg. "http://localhost:3000"  
host = "http://localhost:3000"  
# GoodData.CN user token  
token = "some_user_token"  
sdk = GoodDataSdk.create(host, token)  
  
data_source_id = "demo-test-ds"  
  
# Scan schemata of the data source  
schemata = sdk.catalog_data_source.scan_schemata(data_source_id=data_source_id)  
print(schemata)  
# ['demo']  
  
# Scan and put pdm  
sdk.catalog_data_source.scan_and_put_pdm(data_source_id=data_source_id)  
  
# Define request for generating ldm  
generate_ldm_request = CatalogGenerateLdmRequest(separator="__")  
  
# Generate ldm  
declarative_model = sdk.catalog_data_source.generate_logical_model(data_source_id=data_  
    ↵source_id,  
                           generate_ldm_  
    ↵request=generate_ldm_request)  
  
# Invalidate cache of your computed reports  
sdk.catalog_data_source.register_upload_notification(data_source_id=data_source_id)
```

2.4 Catalog User Service

The `gooddata_sdk.catalog_user` service enables you to perform the following actions on users and user groups:

- Get and list existing users and user groups
- Update or delete existing users and user groups
- Create new users and user groups
- Store and restore users and user groups from directory layout structure

The service supports two types of methods:

- Entity methods let you work with users and user groups on a high level using simplified *CatalogUser* and *CatalogUserGroup* entities.
- Declarative methods allow you to work with users and user groups on a more granular level by fetching entire users and user groups layouts.

2.4.1 Entity methods

Users

The `gooddata_sdk.catalog_user` supports the following user entity API calls:

- `create_or_update_user(user: CatalogUser)`
Create a new user or overwrite an existing user.
- `get_user(user_id: str)`
Returns `CatalogUser`.
Get an individual user.
- `delete_user(user_id: str)`
Delete a user.
- `list_users()`
Returns `List[CatalogUser]`.
Get a list of all existing users.

Example Usage

```
from gooddata_sdk import GoodDataSdk, CatalogUser

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# List users
users = sdk.catalog_user.list_users()

print(users)
# [
#   CatalogUser(id='demo2',
#               attributes=CatalogUserAttributes(authentication_id=
# →'CiRmYmNhNDkwOS04YzYxLTRmMTYtODI3NC1iNzI0Njk1Y2FmNTESBWxvY2Fs'),
#               relationships=CatalogUserRelationships(user_-
# →groups=CatalogUserGroupsData(data=[CatalogUserGroup(id='demoGroup',_
# →relationships=None)]))),
#   ...
# ]

# Define user
user = CatalogUser.init(user_id="abc", authentication_id="xyz", user_group_ids=["demoGroup"])
# Create user
sdk.catalog_user.create_or_update_user(user=user)

# Delete user
sdk.catalog_user.delete_user(user_id=user.id)
```

User groups

The `gooddata_sdk.catalog_user` supports the following user groups entity API calls:

- `create_or_update_user_group(user_group: CatalogUserGroup)`
Create a new user group or overwrite an existing user group.
- `get_user_group(user_group_id: str)`
Returns `CatalogUserGroup`.
Get an individual user group.
- `delete_user_group(user_group_id: str)`
Delete a user group.
- `list_user_groups()`
Returns `List[CatalogUserGroup]`.
Get a list of all existing user groups.

Example Usage

```
from gooddata_sdk import GoodDataSdk, CatalogUserGroup

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# List user groups
user_groups = sdk.catalog_user.list_user_groups()

print(user_groups)
#[  
#   CatalogUserGroup(id='adminGroup', relationships=None),  
#   CatalogUserGroup(id='adminQA1Group',  
#     relationships=CatalogUserGroupRelationships(parents=CatalogUserGroupParents(data=[CatalogUserGroup(id='adminGroup', relationships=None)])))  
#   ...  
#]

# Define user
user_group = CatalogUserGroup.init(user_group_id="xyz", user_group_parent_ids=["demoGroup"])

# Create user
sdk.catalog_user.create_or_update_user_group(user_group=user_group)

# Delete user
sdk.catalog_user.delete_user_group(user_group_id=user_group.id)
```

2.4.2 Declarative methods

Users

The `gooddata_sdk.catalog_user` supports the following declarative user API calls:

- `get_declarative_users()`
Returns `CatalogDeclarativeUsers`.
Retrieve all users including authentication properties.
- `put_declarative_users(users: CatalogDeclarativeUsers)`
Set all users and their authentication properties.
- `store_declarative_users(layout_root_path: Path = Path.cwd())`
Store users in directory hierarchy.

```
gooddata_layouts
└── organization_id
    └── users
        └── users.yaml
```

- `load_declarative_users(layout_root_path: Path = Path.cwd())`
Load users from directory hierarchy.
- `load_and_put_declarative_users(layout_root_path: Path = Path.cwd())`
This method combines `load_declarative_users` and `put_declarative_users` methods to load and set users stored using `store_declarative_users`.

Example Usage

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# Get user layout
user_layout = sdk.catalog_user.get_declarative_users()

print(user_layout)
# CatalogDeclarativeUsers(
#     users=[
#         CatalogDeclarativeUser(id='admin',
#             auth_id=None,
#             user_groups=[CatalogUserGroupIdentifier(id=
#                 'adminGroup', type='userGroup')]),
#         CatalogDeclarativeUser(id='demo', ...
#     ...
# )

# Modify user layout
user_layout.users = []
```

(continues on next page)

(continued from previous page)

```
# Update user layout
sdk.catalog_user.put_declarative_users(users=user_layout)
```

User groups

The `gooddata_sdk.catalog_user` supports the following declarative user groups API calls:

- `get_declarative_user_groups()`
Returns `CatalogDeclarativeUserGroups`.
Retrieve all user-groups eventually with parent group.
- `put_declarative_user_groups(user_groups: CatalogDeclarativeUserGroups)`
Set all user groups with their parents eventually.
- `store_declarative_user_groups(layout_root_path: Path = Path.cwd())`
Store user groups in directory hierarchy.

```
gooddata_layouts
└── organization_id
    └── user_groups
        └── user_groups.yaml
```

- `load_declarative_user_groups(layout_root_path: Path = Path.cwd())`
Returns `CatalogDeclarativeUserGroups`.
Load user groups from directory hierarchy.
- `load_and_put_declarative_user_groups(layout_root_path: Path = Path.cwd())`
This method combines `load_declarative_user_groups` and `put_declarative_user_groups` methods to load and set user groups stored using `store_declarative_user_groups`.

Example Usage

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# Get user layout
user_group_layout = sdk.catalog_user.get_declarative_user_groups()

print(user_group_layout)
# CatalogDeclarativeUserGroups(
#     user_groups=[
#         CatalogDeclarativeUserGroup(id='adminGroup', parents=None),
#     ...
# ]
```

(continues on next page)

(continued from previous page)

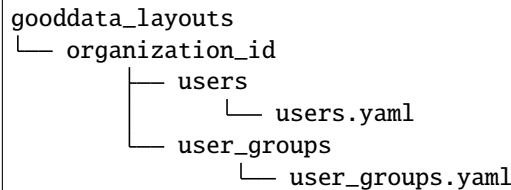

```
# Modify user group layout
user_group_layout.user_groups = []

# Update user group layout
sdk.catalog_user.put_declarative_users(users=user_group_layout)
```

Users and user groups

The `gooddata_sdk.catalog_user` supports the following declarative users and user groups API calls:

- `get_declarative_users_user_groups()`
Returns `CatalogDeclarativeUsersUserGroups`.
Retrieve all users and all user-groups.
- `put_declarative_users_user_groups(users_user_groups: CatalogDeclarativeUsersUserGroups)`
Set all users and user groups.
- `store_declarative_users_user_groups(layout_root_path: Path = Path.cwd())`
Store users and user groups in directory hierarchy.

- `load_declarative_users_user_groups(layout_root_path: Path = Path.cwd())`
Returns `CatalogDeclarativeUsersUserGroups`.
Load users and user groups from directory hierarchy.
- `load_and_put_declarative_users_user_groups(layout_root_path: Path = Path.cwd())`
This method combines `load_declarative_users_user_groups` and `put_declarative_users_user_groups` methods to load and set users and user groups stored using `store_declarative_users_user_groups`.

2.5 Catalog Permission Service

The `gooddata_sdk.catalog_permission` service enables you to perform the following actions on permissions:

- Get and set declarative permissions

2.5.1 Declarative methods

The `gooddata_sdk.catalog_permission` supports the following declarative API calls:

- `get_declarative_permissions(workspace_id: str)`
Returns *CatalogDeclarativeWorkspacePermissions*.
Retrieve current set of permissions of the workspace in a declarative form.
- `put_declarative_permissions(workspace_id: str, declarative_workspace_permissions: CatalogDeclarativeWorkspacePermissions)`
Set effective permissions for the workspace.

Example Usage

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

workspace_id = "demo"

# Get permissions in declarative form
declarative_permissions = sdk.catalog_permission.get_declarative_permissions(workspace_
    ↴id=workspace_id)

declarative_permissions.permissions = []

# Update permissions on the server with your changes
sdk.catalog_permission.put_declarative_permissions(workspace_id=workspace_id,
    ↴declarative_workspace_
    ↴permissions=declarative_permissions)
```

2.6 Catalog Organization Service

The `gooddata_sdk.catalog_organization` service enables you to perform the following actions on organization:

- Update OIDC parameters
- Update organization name

2.6.1 Entity methods

The `gooddata_sdk.catalog_organization` supports the following entity API calls:

- `update_oidc_parameters(oauth_issuer_location: Optional[str] = None, oauth_client_id: Optional[str] = None, oauth_client_secret: Optional[str] = None)`
Update OIDC parameters of organization.
- `update_name(name: str)`
Update name of organization.

Example Usage

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

# Update organization name
sdk.catalog_organization.update_name(name="new_organization_name")

# Update OIDC provider
sdk.catalog_organization.update_oidc_parameters(oauth_client_id="oauth_client_id",
                                                 oauth_issuer_location="oauth_issuer_
                                                 location",
                                                 oauth_client_secret="oauth_client_secret")
```

2.7 Insights Service

The `gooddata_sdk.insights` service gives you access to insights stored in a workspace. It can retrieve all the insights from a workspace or one insight based on its name. Insight instance is the input for other services like a Table service

2.7.1 Entity methods

The `gooddata_sdk.insights` supports the following entity API calls:

- `get_insights(workspace_id: str)`
Returns `list[Insight]`.
Retrieve a list of Insight objects.

Example usage:

Read all insights in a workspace:

```
from gooddata_sdk import GoodDataSdk
```

(continues on next page)

(continued from previous page)

```
# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

workspace_id = "demo"

# Reads insights from workspace
insights = sdk.insights.get_insights(workspace_id)
# Print all fetched insights
for insight in insights:
    print(str(insight))
```

2.8 Compute Service

The `gooddata_sdk.compute` service drives computation of analytics for GoodData.CN workspaces. The prescription of what to compute is encapsulated by the `ExecutionDefinition` which consists of attributes, metrics, filters and definition of dimensions that influence how to organize the data in the result.

Higher level services like Table service use Compute service to execute computation in GoodData.CN. Higher level service is also responsible for results presentation to the user e.g. in tabular form.

2.8.1 Entity methods

The `gooddata_sdk.compute` supports the following entity API calls:

- `for_exec_def(workspace_id: str, exec_def: ExecutionDefinition)`
Returns `ExecutionResponse`.
Starts computation in GoodData.CN workspace, using the provided execution definition.

2.9 Table Service

The `gooddata_sdk.table` service allows you to consume analytics in typical tabular format. The service allows free-form computations and computations of data for GoodData.CN Insights.

2.9.1 Entity methods

The `gooddata_sdk.table` supports the following entity API calls:

- `for_insight(workspace_id: str, insight: Insight)`
Returns `ExecutionTable`.
Retrieve data as an `ExecutionTable` from the given insight.
- `for_items(workspace_id: str, items: list[Union[Attribute, Metric]], filters: Optional[list[Filter]] = None)`

Returns *ExecutionTable*.

Retrieve data as an *ExecutionTable* from the given list of attributes/metrics, and filters.

Example usage:

Get tabular data for an insight defined on your GoodData.CN server:

```
from gooddata_sdk import GoodDataSdk

# GoodData.CN host in the form of uri eg. "http://localhost:3000"
host = "http://localhost:3000"
# GoodData.CN user token
token = "some_user_token"
sdk = GoodDataSdk.create(host, token)

workspace_id = "demo"
insight_id = "some_insight_id_in_demo_workspace"

# Reads insight from workspace
insight = sdk.insights.get_insight(workspace_id, insight_id)

# Triggers computation for the insight. the result will be returned in a tabular form
table = sdk.tables.for_insight(workspace_id, insight)

# This is how you can read data row-by-row and do something with it
for row in table.read_all():
    print(row)

# An example of data printed for insight top_10_products
# {'781952e728204dcf923142910cc22ae2': 'Biolid', 'fe513cef1c6244a5ac21c5f49c56b108': 'Outdoor',

```

API REFERENCE

`gooddata_sdk`

The `gooddata-sdk` package aims to provide clean and convenient Python APIs to interact with GoodData.CN.

3.1 gooddata_sdk

The `gooddata-sdk` package aims to provide clean and convenient Python APIs to interact with GoodData.CN.

At the moment the SDK provides services to inspect and interact with the Semantic Model and consume analytics.

Modules

`gooddata_sdk.catalog`

`gooddata_sdk.client`

Module containing a class that provides access to metadata and afm services.

`gooddata_sdk.compute`

`gooddata_sdk.insight`

`gooddata_sdk.sdk`

`gooddata_sdk.support`

`gooddata_sdk.table`

`gooddata_sdk.type_converter`

`gooddata_sdk.utils`

3.1.1 gooddata_sdk.catalog

Modules

`gooddata_sdk.catalog.base`

`gooddata_sdk.catalog.catalog_service_base`

`gooddata_sdk.catalog.data_source`

`gooddata_sdk.catalog.entity`

`gooddata_sdk.catalog.identifier`

`gooddata_sdk.catalog.organization`

`gooddata_sdk.catalog.permission`

`gooddata_sdk.catalog.setting`

`gooddata_sdk.catalog.types`

`gooddata_sdk.catalog.user`

`gooddata_sdk.catalog.workspace`

gooddata_sdk.catalog.base

Functions

`value_in_allowed(instance, attribute, value)`

gooddata_sdk.catalog.base.value_in_allowed

`gooddata_sdk.catalog.base.value_in_allowed(instance: Type[Base], attribute: Attribute, value: str) → None`

Classes

`Base()`

gooddata_sdk.catalog.base.Base

`class gooddata_sdk.catalog.base.Base`

Bases: `object`

`__init__()` → `None`

Method generated by attrs for class `Base`.

Methods

<code>__init__()</code>	Method generated by attrs for class <code>Base</code> .
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or `snake_case`.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or `snake_case` can be specified.

gooddata_sdk.catalog.catalog_service_base

Classes

`CatalogServiceBase(api_client)`

gooddata_sdk.catalog.catalog_service_base.CatalogServiceBase

```
class gooddata_sdk.catalog.catalog_service_base.CatalogServiceBase(api_client:  
                                         GoodDataApiClient)  
    Bases: object  
    __init__(api_client: GoodDataApiClient) → None
```

Methods

Bases: *Base*

__init__(*, id: str, type: str) → None

Method generated by attrs for class CatalogAssigneeIdentifier.

Methods

__init__ (*, id, type)	Method generated by attrs for class CatalogAssigneeIdentifier.
client_class()	
from_api (entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict (data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict ([camel_case])	Converts object into dictionary.

Attributes

id

type

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogGrainIdentifier

```
class gooddata_sdk.catalog.identifier.CatalogGrainIdentifier(*, id: str, type: str)
```

Bases: *Base*

__init__(*, id: str, type: str) → None

Method generated by attrs for class CatalogGrainIdentifier.

Methods

<code>__init__(*, id, type)</code>	Method generated by attrs for class CatalogGrainIdentifier.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>type</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogLabelIdentifier

`class gooddata_sdk.catalog.identifier.CatalogLabelIdentifier(*, id: str, type: str)`

Bases: `Base`

`__init__(*, id: str, type: str) → None`

Method generated by attrs for class CatalogLabelIdentifier.

Methods

<code>__init__(*, id, type)</code>	Method generated by attrs for class CatalogLabelIdentifier.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`id`

`type`

classmethod `from_api`(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict`(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogReferenceIdentifier

class gooddata_sdk.catalog.identifier.CatalogReferenceIdentifier(*, id: str)

Bases: `Base`

`__init__(*, id: str) → None`

Method generated by attrs for class CatalogReferenceIdentifier.

Methods

<code>__init__(*, id)</code>	Method generated by attrs for class CatalogReferenceIdentifier.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>	
<code>classmethod from_api(entity: Dict[str, Any]) → T</code>	
	Creates object from entity passed by client class, which represents it as dictionary.
<code>classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T</code>	
	Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.
<code>to_dict(camel_case: bool = True) → Dict[str, Any]</code>	
	Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogUserGroupIdentifier

`class gooddata_sdk.catalog.identifier.CatalogUserGroupIdentifier(*, id: str, type: str)`

Bases: `Base`

`__init__(*, id: str, type: str) → None`

Method generated by attrs for class CatalogUserGroupIdentifier.

Methods

<code>__init__(*, id, type)</code>	Method generated by attrs for class CatalogUserGroupIdentifier.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`id`

`type`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.identifier.CatalogWorkspaceIdentifier`class gooddata_sdk.catalog.identifier.CatalogWorkspaceIdentifier(*, id: str)`

Bases: `Base`

`__init__(*, id: str) → None`

Method generated by attrs for class CatalogWorkspaceIdentifier.

Methods

`__init__(*, id)` Method generated by attrs for class CatalogWorkspaceIdentifier.

`client_class()`

`from_api(entity)` Creates object from entity passed by client class, which represents it as dictionary.

`from_dict(data[, camel_case])` Creates object from dictionary.

`to_api()`

`to_dict([camel_case])` Converts object into dictionary.

Attributes

`id`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

                                         Op-
                                         tional[str]
                                         =
                                         None)
```

Bases: *Base*

`__init__(*, name: Optional[str] = None, hostname: Optional[str] = None, allowed_origins: Optional[List[str]] = None, oauth_issuer_location: Optional[str] = None, oauth_client_id: Optional[str] = None) → None`

Method generated by attrs for class CatalogOrganizationAttributes.

Methods

<code>__init__(*[name, hostname, ...])</code>	Method generated by attrs for class CatalogOrganizationAttributes.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`name`

`hostname`

`allowed_origins`

`oauth_issuer_location`

`oauth_client_id`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.organization.entity_model.organization.CatalogOrganizationDocument

```
class gooddata_sdk.catalog.organization.entity_model.organization.CatalogOrganizationDocument(*,
                                         data: CatalogOrganization)
```

Bases: `Base`

`__init__(*, data: CatalogOrganization) → None`

Method generated by attrs for class CatalogOrganizationDocument.

Methods

<code>__init__(*, data)</code>	Method generated by attrs for class CatalogOrganizationDocument.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api([oauth_client_secret])</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`data`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.organization.service

Classes

`CatalogOrganizationService(api_client)`

gooddata_sdk.catalog.organization.service.CatalogOrganizationService

class `gooddata_sdk.catalog.organization.service.CatalogOrganizationService(api_client: GoodDataApiClient)`

Bases: `CatalogServiceBase`

`__init__(api_client: GoodDataApiClient) → None`

Methods

```
__init__(api_client)
get_organization()
layout_organization_folder(layout_root_path)
update_name(name)
update_oidc_parameters([...])
```

Attributes

```
organization_id
```

Method generated by attrs for class CatalogDeclarativeDataSourcePermission.

Methods

__init__(*, name, assignee)	Method generated by attrs for class CatalogDeclarativeDataSourcePermission.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

name

assignee

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeSingleWorkspacePermission

```
class gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeSingleWorkspacePerm
```

Bases: `Base`

`__init__(*, name: str, assignee: CatalogAssigneeIdentifier) → None`

Method generated by attrs for class CatalogDeclarativeSingleWorkspacePermission.

Methods

<code>__init__(*, name, assignee)</code>	Method generated by attrs for class CatalogDeclarativeSingleWorkspacePermission.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`name`

`assignee`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeWorkspaceHierarchyPermission

class gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeWorkspaceHierarchyPermission

Bases: `Base`

`__init__(*, name: str, assignee: CatalogAssigneeIdentifier) → None`

Method generated by attrs for class CatalogDeclarativeWorkspaceHierarchyPermission.

Methods

<code>__init__(*, name, assignee)</code>	Method generated by attrs for class CatalogDeclarativeWorkspaceHierarchyPermission.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`name`

`assignee`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeWorkspacePermissions

```
class gooddata_sdk.catalog.permission.declarative_model.permission.CatalogDeclarativeWorkspacePermissions
```

Bases: `Base`

__init__(**permissions*: `List[CatalogDeclarativeSingleWorkspacePermission]`) = `NOTHING`,
hierarchy_permissions: `List[CatalogDeclarativeWorkspaceHierarchyPermission]`) = `NOTHING`)
→ None

Method generated by attrs for class CatalogDeclarativeWorkspacePermissions.

Methods

<code>__init__(</code> *[<i>permissions</i> , <i>hierarchy_permissions</i>])	Method generated by attrs for class CatalogDeclarativeWorkspacePermissions.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`permissions`

`hierarchy_permissions`

classmethod `from_api(entity: Dict[str, Any])` → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True)` → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.permission.service

Classes

`CatalogPermissionService(api_client)`

gooddata_sdk.catalog.permission.service.CatalogPermissionService

class gooddata_sdk.catalog.permission.service.**CatalogPermissionService**(*api_client: GoodDataApiClient*)

Bases: `CatalogServiceBase`

__init__(*api_client: GoodDataApiClient*) → None

Methods

__init__(*api_client*)

get_declarative_permissions(*workspace_id*)

get_organization()

layout_organization_folder(*layout_root_path*)

put_declarative_permissions(*workspace_id, ...*)

Attributes

organization_id

gooddata_sdk.catalog.setting**Classes**

`CatalogDeclarativeSetting(*, id[, content])`

gooddata_sdk.catalog.setting.CatalogDeclarativeSetting

`class gooddata_sdk.catalog.setting.CatalogDeclarativeSetting(*, id: str, content: Optional[Dict[str, Any]] = None)`

Bases: `Base`

`__init__(*, id: str, content: Optional[Dict[str, Any]] = None) → None`

Method generated by attrs for class CatalogDeclarativeSetting.

Methods

<code>__init__(*, id[, content])</code>	Method generated by attrs for class CatalogDeclarativeSetting.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`id`

`content`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

```

Method generated by attrs for class CatalogUser.

Methods

<code>__init__(*, id[, attributes, relationships])</code>	Method generated by attrs for class CatalogUser.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>init(user_id[, authentication_id, ...])</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>get_user_groups</code>	
<code>id</code>	
<code>attributes</code>	
<code>relationships</code>	

classmethod `from_api(entity: Dict[str, Any]) → T`
Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`
Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`
Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserAttributes

class gooddata_sdk.catalog.user.entity_model.user.CatalogUserAttributes(*, authentication_id: Optional[str] = None)
Bases: `Base`

`__init__(*, authentication_id: Optional[str] = None) → None`
Method generated by attrs for class CatalogUserAttributes.

Methods

<code>__init__(*[, authentication_id])</code>	Method generated by attrs for class CatalogUserAttributes.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`authentication_id`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserDocument

class `gooddata_sdk.catalog.user.entity_model.user.CatalogUserDocument(*, data: CatalogUser)`

Bases: `Base`

`__init__(*, data: CatalogUser) → None`

Method generated by attrs for class CatalogUserDocument.

Methods

<code>__init__(*, data)</code>	Method generated by attrs for class CatalogUserDocument.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>init(user_id[, authentication_id, ...])</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.
<code>update_user([authentication_id, user_group_ids])</code>	

Attributes

`data`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserGroupsData

`class gooddata_sdk.catalog.user.entity_model.user.CatalogUserGroupsData(*, data: Optional[List[CatalogUserGroup]] = None)`

Bases: `Base`

`__init__(*, data: Optional[List[CatalogUserGroup]] = None) → None`

Method generated by attrs for class CatalogUserGroupsData.

Methods

<code>__init__(*[, data])</code>	Method generated by attrs for class CatalogUserGroupsData.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`get_user_groups`

`data`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user.CatalogUserRelationships

class `gooddata_sdk.catalog.user.entity_model.user.CatalogUserRelationships(*, user_groups: Optional[CatalogUserGroupsData] = None)`

Bases: `Base`

`__init__(*, user_groups: Optional[CatalogUserGroupsData] = None) → None`

Method generated by attrs for class CatalogUserRelationships.

Methods

<code>__init__(*[, user_groups])</code>	Method generated by attrs for class CatalogUserRelationships.
<code>client_class()</code>	
<code>create_user_relationships(user_group_ids)</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>get_user_groups</code>
<code>user_groups</code>

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group

Classes

`CatalogUserGroup(*, id[, relationships])`

`CatalogUserGroupDocument(*, data)`

`CatalogUserGroupParents(*[, data])`

`CatalogUserGroupRelationships(*[, parents])`

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroup

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroup(*, id: str,  
                           relationships: Optional[CatalogUserGroupRelationships]  
                           = None)
```

Bases: *Base*

__init__(**, id: str, relationships: Optional[CatalogUserGroupRelationships] = None*) → None

Method generated by attrs for class CatalogUserGroup.

Methods

__init__ (* <i>, id[, relationships]</i>)	Method generated by attrs for class CatalogUserGroup.
client_class()	
from_api (entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict (data[, camel_case])	Creates object from dictionary.
init (user_group_id[, user_group_parent_ids])	
to_api()	
to_dict ([camel_case])	Converts object into dictionary.

Attributes

get_parents	
id	
relationships	

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupDocument

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupDocument(*, data:  
    CatalogUserGroup)
```

Bases: *Base*

__init__(*, data: CatalogUserGroup) → None

Method generated by attrs for class CatalogUserGroupDocument.

Methods

__init__(*, data)	Method generated by attrs for class CatalogUserGroupDocument.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
init(user_group_id[, user_group_parent_ids])	
to_api()	
to_dict([camel_case])	Converts object into dictionary.
update_user_group([user_group_parents_id])	

Attributes

data

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupParents

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupParents(*, data: Optional[List[CatalogUserGroup]] = None)
```

Bases: *Base*

__init__(*, data: Optional[List[CatalogUserGroup]] = None) → None

Method generated by attrs for class CatalogUserGroupParents.

Methods

__init__(*[data])	Method generated by attrs for class CatalogUserGroupParents.
client_class()	
from_api(entity)	Creates object from entity passed by client class, which represents it as dictionary.
from_dict(data[, camel_case])	Creates object from dictionary.
to_api()	
to_dict([camel_case])	Converts object into dictionary.

Attributes

get_parents

data

classmethod from_api(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupRelationships

```
class gooddata_sdk.catalog.user.entity_model.user_group.CatalogUserGroupRelationships(*, parents: Optional[CatalogUserGroup] = None)
```

Bases: `Base`

`__init__(*, parents: Optional[CatalogUserGroupParents] = None) → None`

Method generated by attrs for class CatalogUserGroupRelationships.

Methods

<code>__init__(*[parents])</code>	Method generated by attrs for class CatalogUserGroupRelationships.
<code>client_class()</code>	
<code>create_user_group_relationships(...)</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`get_parents`

`parents`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.user.service

Classes

`CatalogUserService(api_client)`

gooddata_sdk.catalog.user.service.CatalogUserService

```
class gooddata_sdk.catalog.user.service.CatalogUserService(api_client: GoodDataApiClient)
    Bases: CatalogServiceBase
    __init__(api_client: GoodDataApiClient) → None
```

Methods

```
__init__(api_client)

create_or_update_user(user)

create_or_update_user_group(user_group)

delete_user(user_id)

delete_user_group(user_group_id)

get_declarative_user_groups()

get_declarative_users()

get_declarative_users_user_groups()

get_organization()

get_user(user_id)

get_user_group(user_group_id)

layout_organization_folder(layout_root_path)

list_user_groups()

list_users()

load_and_put_declarative_user_groups(...)

load_and_put_declarative_users(...)

<code>load_declarative_ldm(workspace_id[, ...])</code>	
<code>put_declarative_analytics_model(...)</code>	
<code>put_declarative_ldm(workspace_id, ldm[, ...])</code>	
<code>store_declarative_analytics_model(workspace_id)</code>	
<code>store_declarative_ldm(workspace_id[, ...])</code>	

Attributes

organization_id

compute_valid_objects(workspace_id: str, ctx: Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric, List[Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric]]], ExecutionDefinition) → Dict[str, Set[str]]

Returns attributes, facts, and metrics which are valid to add to a context that already contains some entities from the semantic model. The entities are typically used to compute analytics and come from the execution definition. You may, however, specify the entities through different layers of convenience.

Parameters

- **workspace_id** – workspace identifier
- **ctx** – items already in context. you can specify context in one of the following ways:
 - single item or list of items from the execution model
 - single item or list of items from catalog model; catalog fact, label or metric may be added
 - the entire execution definition that is used to compute analytics

Returns

a dict of sets; type of available object is used as key in the dict, the value is a set containing id's of available items

get_full_catalog(workspace_id: str) → CatalogWorkspaceContent

Retrieves catalog for a workspace. Catalog contains all data sets and metrics defined in that workspace.

Parameters

workspace_id – workspace identifier

gooddata_sdk.catalog.workspace.declarative_model

<code>data_source_id</code>

classmethod `from_api`(entity: Dict[str, Any]) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict`(data: Dict[str, Any], camel_case: bool = True) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.Dataset.CatalogDeclarative`

```
class gooddata_sdk.catalog.workspace.declarative_model.workspace.logical_model.dataset.dataset.CatalogD
```

Bases: *Base*

```
__init__(*, id: str, title: str, source_column: str, labels: List[CatalogDeclarativeLabel], default_view:  
        Optional[CatalogLabelIdentifier] = None, sort_column: Optional[str] = None, sort_direction:  
        Optional[str] = None, description: Optional[str] = None, tags: Optional[List[str]] = None) →  
        None
```

Method generated by attrs for class CatalogDeclarativeAttribute.

Methods

<code>__init__(*, id, title, source_column, labels)</code>	Method generated by attrs for class CatalogDeclarativeAttribute.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`id`
`title`
`column_name`
`workspace_data_filter_settings`
`description`
`workspace`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: dict[str, Any], camel_case: bool = True) → CatalogDeclarativeWorkspaceDataFilter`

Parameters

- **data** – Data loaded for example from the file.
- **camel_case** – True if the variable names in the input data are serialized names as specified in the OpenAPI document. False if the variables names in the input data are python variable names in PEP-8 snake case.

Returns

`CatalogDeclarativeWorkspaceDataFilter` object.

to_dict(camel_case: bool = True) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

```
gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilterSetting
```

```
class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilterSetting(*, id: str, title: str, filter_values: List[str], workspace: CatalogWorkspaceIdentifier, description: Optional[str] = None) → None
```

Bases: *Base*

`__init__(*, id: str, title: str, filter_values: List[str], workspace: CatalogWorkspaceIdentifier, description: Optional[str] = None) → None`

Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilterSetting.

Methods

<code>__init__(*, id, title, filter_values, workspace)</code>	Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilterSetting.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`id`
`title`
`filter_values`
`workspace`
`description`

classmethod `from_api`(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict`(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict`(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilter

class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceDataFilters

Bases: *Base*

`__init__`(**, workspace_data_filters: List[CatalogDeclarativeWorkspaceDataFilter]*) → None

Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilters.

Methods

<code>__init__</code> (* <i>, workspace_data_filters)</i>	Method generated by attrs for class CatalogDeclarativeWorkspaceDataFilters.
<code>client_class()</code>	
<code>from_api</code> (<i>entity</i>)	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict</code> (<i>data</i> [, <i>camel_case</i>])	Creates object from dictionary.
<code>load_from_disk</code> (<i>layout_organization_folder</i>)	
<code>store_to_disk</code> (<i>layout_organization_folder</i>)	
<code>to_api()</code>	
<code>to_dict</code> ([<i>camel_case</i>])	Converts object into dictionary.

Attributes

`workspace_data_filters`

classmethod `from_api`(*entity: Dict[str, Any]*) → T

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict`(*data: Dict[str, Any]*, *camel_case: bool = True*) → T

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict`(*camel_case: bool = True*) → Dict[str, Any]

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceModel

class gooddata_sdk.catalog.workspace.declarative_model.workspace.workspace.CatalogDeclarativeWorkspaceM

Bases: `Base`

`__init__`(**, ldm: Optional[CatalogDeclarativeLdm] = None*, *analytics: Optional[CatalogDeclarativeAnalyticsLayer] = None*) → None

Method generated by attrs for class CatalogDeclarativeWorkspaceModel.

Methods

<code>__init__(*[ldm, analytics])</code>	Method generated by attrs for class CatalogDeclarativeWorkspaceModel.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(workspace_folder)</code>	
<code>store_to_disk(workspace_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`ldm`

`analytics`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.declarative_model.workspace.CatalogDeclarativeWorkspaces

class gooddata_sdk.catalog.workspace.declarative_model.workspace.CatalogDeclarativeWorkspaces

Bases: `Base`

`__init__(*, workspaces: List[CatalogDeclarativeWorkspace], workspace_data_filters: List[CatalogDeclarativeWorkspaceDataFilter]) → None`

Method generated by attrs for class CatalogDeclarativeWorkspaces.

Methods

<code>__init__(*, workspaces, workspace_data_filters)</code>	Method generated by attrs for class CatalogDeclarativeWorkspaces.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>load_from_disk(layout_organization_folder)</code>	
<code>store_to_disk(layout_organization_folder)</code>	
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.
<code>workspace_data_filters_folder(...)</code>	
<code>workspaces_folder(layout_organization_folder)</code>	

Attributes

`workspaces`

`workspace_data_filters`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

title

type

filter_dataset(*valid_objects*: Dict[str, Set[str]]) → Optional[CatalogDataset]

Filters dataset so that it contains only attributes and facts that are part of the provided valid objects structure.

Parameters

valid_objects – mapping of object type to a set of valid object ids

Returns

CatalogDataset containing only valid attributes and facts; None if all of the attributes and facts were filtered out

gooddata_sdk.catalog.workspace.entity_model.content_objects.dataset.CatalogFact

class gooddata_sdk.catalog.workspace.entity_model.content_objects.dataset.CatalogFact(*entity*: dict[str, Any])

Bases: CatalogEntity

`CatalogDependentEntitiesRequest(*[,
identi-
fiers])`

`CatalogDependentEntitiesResponse(*, graph)`

`CatalogEntityIdentifier(*, id, type)`

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesGraph

```
class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesGraph(*,  
node  
List[  
= NOTHING  
edge  
List[  
= NOTHING  
ING
```

Bases: `Base`

`__init__(*, nodes: List[CatalogDependentEntitiesNode] = NOTHING, edges:
List[List[CatalogEntityIdentifier]] = NOTHING) → None`

Method generated by attrs for class CatalogDependentEntitiesGraph.

Methods

<code>__init__(*[nodes, edges])</code>	Method generated by attrs for class CatalogDependentEntitiesGraph.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`nodes`

`edges`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesNode

```
class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesNode(*,
                                             id: str,
                                             type: str,
                                             title: Optional[str] = None)
```

Bases: `Base`

`__init__(*, id: str, type: str, title: Optional[str] = None) → None`

Method generated by attrs for class CatalogDependentEntitiesNode.

Methods

<code>__init__(*, id, type[, title])</code>	Method generated by attrs for class CatalogDependentEntitiesNode.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>	
<code>type</code>	
<code>title</code>	

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesRequest`

```
class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesRequest(*,
    id: str,
    title: str,
    filters: List[CatalogEntityFilter],
    limit: int = 100,
    offset: int = 0,
    sort: List[CatalogEntitySort] = None,
    include_instrumentation: bool = False)
```

Bases: `Base`

`__init__(*, identifiers: List[CatalogEntityIdentifier] = NOTHING) → None`

Method generated by attrs for class CatalogDependentEntitiesRequest.

Methods

<code>__init__(*[, identifiers])</code>	Method generated by attrs for class CatalogDependentEntitiesRequest.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`identifiers`

`classmethod from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

`classmethod from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

`gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesResponse`

`class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogDependentEntitiesResponse(`

Bases: `Base`

`__init__(*, graph: CatalogDependentEntitiesGraph) → None`

Method generated by attrs for class CatalogDependentEntitiesResponse.

Methods

<code>__init__(*, graph)</code>	Method generated by attrs for class CatalogDependentEntitiesResponse.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

`graph`

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogEntityIdentifier

```
class gooddata_sdk.catalog.workspace.entity_model.graph_objects.graph.CatalogEntityIdentifier(*,
                                         id: str,
                                         type: str)
```

Bases: `Base`

`__init__(*, id: str, type: str) → None`

Method generated by attrs for class CatalogEntityIdentifier.

Methods

<code>__init__(*, id, type)</code>	Method generated by attrs for class CatalogEntityIdentifier.
<code>client_class()</code>	
<code>from_api(entity)</code>	Creates object from entity passed by client class, which represents it as dictionary.
<code>from_dict(data[, camel_case])</code>	Creates object from dictionary.
<code>to_api()</code>	
<code>to_dict([camel_case])</code>	Converts object into dictionary.

Attributes

<code>id</code>
<code>type</code>

classmethod `from_api(entity: Dict[str, Any]) → T`

Creates object from entity passed by client class, which represents it as dictionary.

classmethod `from_dict(data: Dict[str, Any], camel_case: bool = True) → T`

Creates object from dictionary. It needs to be specified if the dictionary is in camelCase or snake_case.

`to_dict(camel_case: bool = True) → Dict[str, Any]`

Converts object into dictionary. Optional argument if the dictionary should be camelCase or snake_case can be specified.

gooddata_sdk.catalog.workspace.entity_model.workspace

Classes

`CatalogWorkspace(workspace_id, name[, parent_id])`

gooddata_sdk.catalog.workspace.entity_model.workspace.CatalogWorkspace

class `gooddata_sdk.catalog.workspace.entity_model.workspace.CatalogWorkspace(workspace_id: str, name: str, parent_id: Optional[str] = None)`

Bases: `CatalogNameEntity`

`__init__(workspace_id: str, name: str, parent_id: Optional[str] = None)`

Methods

`__init__(workspace_id, name[, parent_id])`

`from_api(entity)`

`to_api()`

gooddata_sdk.catalog.workspace.model_container

Classes

`CatalogWorkspaceContent(valid_obj_fun, ...)`

gooddata_sdk.catalog.workspace.model_container.CatalogWorkspaceContent

```
class gooddata_sdk.catalog.workspace.model_container.CatalogWorkspaceContent(valid_obj_fun:
    func-
    tools.partial[dict[str,
    set[str]]],
    datasets:
    list[CatalogDataset],
    metrics:
    list[CatalogMetric])
```

Bases: `object`

`__init__(valid_obj_fun: functools.partial[dict[str, set[str]]], datasets: list[CatalogDataset], metrics: list[CatalogMetric]) → None`

Methods

`__init__(valid_obj_fun, datasets, metrics)`

`catalog_with_valid_objects(ctx)`

Returns a new instance of catalog which contains only those datasets (attributes and facts) that are valid in the provided context.

`create_workspace_content_catalog(...)`

`find_label_attribute(id_obj)`

Get attribute by label id.

`get_dataset(dataset_id)`

Gets dataset by id.

`get_metric(metric_id)`

Gets metric by id.

Attributes

datasets

metrics

catalog_with_valid_objects(*ctx: Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric, List[Union[Attribute, Metric, Filter, CatalogLabel, CatalogFact, CatalogMetric]], ExecutionDefinition]*) → *CatalogWorkspaceContent*

Returns a new instance of catalog which contains only those datasets (attributes and facts) that are valid in the provided context. The context is composed of one or more entities of the semantic model and the filtered catalog will contain only those entities that can be safely added on top of that existing context.

Parameters

ctx – existing context. You can specify context in one of the following ways:

- single item or list of items from the execution model
- single item or list of items from catalog model; catalog fact, label or metric may be added
- the entire execution definition that is used to compute analytics

find_label_attribute(*id_obj: Union[str, ObjId, Dict[str, Dict[str, str]], Dict[str, str]]*) → *Optional[CatalogAttribute]*

Get attribute by label id.

get_dataset(*dataset_id: Union[str, ObjId]*) → *Optional[CatalogDataset]*

Gets dataset by id. The id can be either an instance of ObjId or string containing serialized ObjId ('dataset/some.dataset.id') or contain just the id part ('some.dataset.id').

Parameters

dataset_id – fully qualified dataset entity id (type/id) or just the identifier of dataset entity

Returns

instance of CatalogDataset or None if no such dataset in catalog

Return type

CatalogDataset

get_metric(*metric_id: Union[str, ObjId]*) → *Optional[CatalogMetric]*

Gets metric by id. The id can be either an instance of ObjId or string containing serialized ObjId ('metric/some.metric.id') or contain just the id part ('some.metric.id').

Parameters

metric_id – fully qualified metric entity id (type/id) or just the identifier of metric entity

Returns

instance of CatalogMetric or None if no such metric in catalog

Return type

CatalogMetric

gooddata_sdk.catalog.workspace.service**Classes**

`CatalogWorkspaceService(api_client)`

gooddata_sdk.catalog.workspace.service.CatalogWorkspaceService

```
class gooddata_sdk.catalog.workspace.service.CatalogWorkspaceService(api_client:  
    GoodDataApiClient)  
Bases: CatalogServiceBase  
__init__(api_client: GoodDataApiClient) → None
```

Methods

```
__init__(api_client)
```

```
create_or_update(workspace)
```

```
delete_workspace(workspace_id)
```

This method is implemented according to our implementation of delete workspace, which returns HTTP 204 no matter if the workspace_id exists.

```
get_declarative_workspace(workspace_id)
```

```
get_declarative_workspace_data_filters()
```

```
get_declarative_workspaces()
```

```
get_organization()
```

```
get_workspace(workspace_id)
```

Gets workspace content and returns it as Catalog-Workspace object.

```
layout_organization_folder(layout_root_path)
```

```
list_workspaces()
```

```
load_and_put_declarative_workspace(workspace_id)
```

```
load_and_put_declarative_workspace_data_filters([...])
```

```
load_and_put_declarative_workspaces([...])
```

```
load_declarative_workspace(workspace_id[  
...])
```

```
load_declarative_workspace_data_filters([...])
```

```
load_declarative_workspaces([layout_root_path])
```

```
put_declarative_workspace(workspace_id, ...)
```

```
put_declarative_workspace_data_filters(...)
```

```
put_declarative_workspaces(workspace)
```

```
store_declarative_workspace(workspace_id[  
...])
```

```
store_declarative_workspace_data_filters([...])
```

```
store_declarative_workspaces([layout_root_path])
```

Attributes

`organization_id`

delete_workspace(*workspace_id*: str) → None

This method is implemented according to our implementation of delete workspace, which returns HTTP 204 no matter if the *workspace_id* exists.

get_workspace(*workspace_id*: str) → *CatalogWorkspace*

Gets workspace content and returns it as *CatalogWorkspace* object.

Parameters

workspace_id – An input string parameter of workspace id.

Returns

CatalogWorkspace object containing structure of workspace.

3.1.2 gooddata_sdk.client

Module containing a class that provides access to metadata and afm services.

Classes

<code>GoodDataApiClient(host, token[, ...])</code>	Provide access to metadata and afm services.
--	--

gooddata_sdk.client.GoodDataApiClient

class `gooddata_sdk.client.GoodDataApiClient`(*host*: str, *token*: str, *custom_headers*: *Optional[dict[str, str]]* = None, *extra_user_agent*: *Optional[str]* = None)

Bases: `object`

Provide access to metadata and afm services.

init(*host*: str, *token*: str, *custom_headers*: *Optional[dict[str, str]]* = None, *extra_user_agent*: *Optional[str]* = None) → None

Take url, token for connecting to GoodData.CN.

HTTP requests made by this class may be enriched by *custom_headers* dict containing header names as keys and header values as dict values.

extra_user_agent is optional string to be added to default http User-Agent header. This takes precedence over *custom_headers* setting.

Methods

`__init__(host, token[, custom_headers, ...])` Take url, token for connecting to GoodData.CN.

Attributes

`afm_client`

`metadata_client`

`scan_client`

3.1.3 gooddata_sdk.compute

Modules

`gooddata_sdk.compute.model`

`gooddata_sdk.compute.service`

gooddata_sdk.compute.model

Modules

`gooddata_sdk.compute.model.attribute`

`gooddata_sdk.compute.model.base`

`gooddata_sdk.compute.model.execution`

`gooddata_sdk.compute.model.filter`

`gooddata_sdk.compute.model.metric`

gooddata_sdk.compute.model.attribute**Classes**

`Attribute(local_id, label)`

gooddata_sdk.compute.model.attribute.Attribute

`class gooddata_sdk.compute.model.attribute.Attribute(local_id: str, label: Union[ObjId, str])`

Bases: `ExecModelEntity`

`__init__(local_id: str, label: Union[ObjId, str]) → None`

Creates new attribute that can be used to slice or dice metric values during computation.

Parameters

- **local_id** – identifier of the attribute within the execution
- **label** – identifier of the label to use for slicing or dicing; specified either as ObjId or str containing the label id

Methods

<code>__init__(local_id, label)</code>	Creates new attribute that can be used to slice or dice metric values during computation.
--	---

`as_api_model()`

`has_same_label(other)`

Attributes

`label`

`local_id`

gooddata_sdk.compute.model.base**Classes**

`ExecModelEntity()`

`Filter()`

`ObjId(id, type)`

gooddata_sdk.compute.model.base.ExecModelEntity

    Bases: object
    __init__() → None
```

Methods

```
__init__()
```

```
as_api_model()
```

gooddata_sdk.compute.model.base.Filter

```
class gooddata_sdk.compute.model.base.Filter
    Bases: ExecModelEntity
    __init__() → None
```

Methods

```
__init__()
```

```
as_api_model()
```

```
is_noop()
```

Attributes

```
apply_on_result
```

gooddata_sdk.compute.model.base.ObjId

```
class gooddata_sdk.compute.model.base.ObjId(id: str, type: str)
    Bases: object
    __init__(id: str, type: str) → None
```

Methods

`__init__(id, type)`

`as_afm_id()`

`as_afm_id_attribute()`

`as_afm_id_dataset()`

`as_afm_id_label()`

`as_identifier()`

Attributes

`id`

`type`

gooddata_sdk.compute.model.execution

Functions

<code>compute_model_to_api_model([attributes, ...])</code>	Transforms categorized execution model entities (attributes, metrics, facts) into an API model that can be used for computations of data results or computations of object availability.
--	--

gooddata_sdk.compute.model.execution.compute_model_to_api_model

gooddata_sdk.compute.model.execution.`compute_model_to_api_model`(*attributes*:
Optional[list[Attribute]] =
None, *metrics*:
Optional[list[Metric]] = *None*,
filters: *Optional[list[Filter]]* =
None) → models.AFM

Transforms categorized execution model entities (attributes, metrics, facts) into an API model that can be used for computations of data results or computations of object availability.

Parameters

- **attributes** – optionally specify list of attributes
- **metrics** – optionally specify list of metrics
- **filters** – optionally specify list of filters

Classes

<code>BareExecutionResponse(actions_api, ...)</code>	Holds ExecutionResponse from triggered report computation and allows reading report's results.
<code>Execution(actions_api, workspace_id, ...)</code>	An envelope class holding execution related classes:
<code>ExecutionDefinition(attributes, metrics, ...)</code>	
<code>ExecutionResponse</code>	alias of <code>Execution</code>
<code>ExecutionResult(result)</code>	
<code>TotalDefinition(local_id, aggregation, ...)</code>	
<code>TotalDimension(idx[, items])</code>	

gooddata_sdk.compute.model.execution.BareExecutionResponse

```
class gooddata_sdk.compute.model.execution.BareExecutionResponse(actions_api: ActionsApi,  
                                                               workspace_id: str, response:  
                                                               AfmExecutionResponse)
```

Bases: object

Holds ExecutionResponse from triggered report computation and allows reading report's results.

```
__init__(actions_api: ActionsApi, workspace_id: str, response: AfmExecutionResponse)
```

Methods

```
__init__(actions_api, workspace_id, response)
```

```
read_result(limit[, offset])
```

Reads from the execution result.

Attributes

```
dimensions
```

```
result_id
```

```
workspace_id
```

```
read_result(limit: Union[int, list[int]], offset: Union[None, int, list[int]] = None) → ExecutionResult
```

Reads from the execution result.

gooddata_sdk.compute.model.execution.Execution

```
class gooddata_sdk.compute.model.execution.Execution(actions_api: ActionsApi, workspace_id: str,  
exec_def: ExecutionDefinition, response:  
AfmExecutionResponse)
```

Bases: object

An envelope class holding execution related classes:

- exec_def ExecutionDefinition
- bare_exec_response BareExecutionResponse

```
__init__(actions_api: ActionsApi, workspace_id: str, exec_def: ExecutionDefinition, response:  
AfmExecutionResponse)
```

Methods

```
__init__(actions_api, workspace_id, ...)
```

```
read_result(limit[, offset])
```

Attributes

```
bare_exec_response
```

```
dimensions
```

```
exec_def
```

```
result_id
```

```
workspace_id
```

gooddata_sdk.compute.model.execution.ExecutionDefinition

```
class gooddata_sdk.compute.model.execution.ExecutionDefinition(attributes:  
Optional[list[Attribute]], metrics:  
Optional[list[Metric]], filters:  
Optional[list[Filter]], dimensions:  
list[Optional[list[str]]], totals:  
Optional[list[TotalDefinition]] =  
None)
```

Bases: object

```
__init__(attributes: Optional[list[Attribute]], metrics: Optional[list[Metric]], filters: Optional[list[Filter]],  
dimensions: list[Optional[list[str]]], totals: Optional[list[TotalDefinition]] = None) → None
```

Methods

```
__init__(attributes, metrics, filters, ...)
```

```
as_api_model()
```

```
has_attributes()
```

```
has_filters()
```

```
has_metrics()
```

```
is_one_dim()
```

```
is_two_dim()
```

Attributes

```
attributes

metrics
```

gooddata_sdk.compute.model.execution.ExecutionResponse

```
gooddata_sdk.compute.model.execution.ExecutionResponse
```

alias of *Execution*

gooddata_sdk.compute.model.execution.ExecutionResult

```
class gooddata_sdk.compute.model.execution.ExecutionResult(result: ExecutionResult)
```

Bases: object

```
__init__(result: ExecutionResult)
```

Methods

```
__init__(result)
check_size_limits(result_size_limits)
get_all_header_values(dim, header_idx)
get_all_headers(dim)
is_complete([dim])
next_page_start([dim])
```

Attributes

```
data
grand_totals
headers
paging
paging_count
paging_offset
paging_total
```

gooddata_sdk.compute.model.execution.TotalDefinition

```
class gooddata_sdk.compute.model.execution.TotalDefinition(local_id: str, aggregation: str,
                                                       metric_local_id: str, total_dims:
                                                       list[TotalDimension])
```

Bases: object

```
__init__(local_id: str, aggregation: str, metric_local_id: str, total_dims: list[TotalDimension]) → None
```

Method generated by attrs for class TotalDefinition.

Methods

<code>__init__(local_id, aggregation, ...)</code>	Method generated by attrs for class TotalDefinition.
---	--

Attributes

<code>local_id</code>	total's local identifier
<code>aggregation</code>	aggregation function; case insensitive; one of SUM, MIN, MAX, MED, AVG
<code>metric_local_id</code>	local identifier of the measure to calculate total for
<code>total_dims</code>	

`aggregation: str`

aggregation function; case insensitive; one of SUM, MIN, MAX, MED, AVG

`local_id: str`

total's local identifier

`metric_local_id: str`

local identifier of the measure to calculate total for

`gooddata_sdk.compute.model.execution.TotalDimension`

`class gooddata_sdk.compute.model.execution.TotalDimension(idx: int, items: list[str] = NOTHING)`

Bases: object

`__init__(idx: int, items: list[str] = NOTHING) → None`

Method generated by attrs for class TotalDimension.

Methods

<code>__init__(idx[, items])</code>	Method generated by attrs for class TotalDimension.
-------------------------------------	---

Attributes

<code>idx</code>	index of dimension in which to calculate the total
<code>items</code>	items to use during total calculation

`idx: int`

index of dimension in which to calculate the total

`items: list[str]`

items to use during total calculation

Exceptions

`ResultSizeLimitsExceeded(result_size_limits, ...)`

gooddata_sdk.compute.model.execution.ResultSizeLimitsExceeded

```
exception gooddata_sdk.compute.model.execution.ResultSizeLimitsExceeded(result_size_limits:
    Tuple[Optional[int],
    ...],
    actual_result_size:
    Tuple[Optional[int],
    ...],
    first_violating_index:
    int)
```

gooddata_sdk.compute.model.filter

Classes

`AbsoluteDateFilter(dataset, from_date, to_date)`

<code>AllTimeFilter()</code>	Filter that is semantically equivalent to absent filter.
<code>AttributeFilter(label[, values])</code>	

`MetricValueFilter(metric, operator, values)`

`NegativeAttributeFilter(label[, values])`

`PositiveAttributeFilter(label[, values])`

`RankingFilter(metrics, operator, value, ...)`

`RelativeDateFilter(dataset, granularity, ...)`

gooddata_sdk.compute.model.filter.AbsoluteDateFilter

```
class gooddata_sdk.compute.model.filter.AbsoluteDateFilter(dataset: ObjId, from_date: str, to_date: str)
```

Bases: `Filter`

`__init__(dataset: ObjId, from_date: str, to_date: str) → None`

Methods

```

```

gooddata_sdk.compute.model.filter.AllTimeFilter

```
class gooddata_sdk.compute.model.filter.AllTimeFilter
```

Bases: *Filter*

Filter that is semantically equivalent to absent filter.

This filter exists because ‘All time filter’ retrieved from GoodData.CN is non-standard as it does not have *from* and *to* fields; this is also the reason why *as_api_model* method is not implemented - it would lead to invalid object.

The main feature of this filter is noop.

```
__init__() → None
```

Methods

```
__init__()
```

```
as_api_model()
```

```
is_noop()
```

Attributes

```
apply_on_result
```

gooddata_sdk.compute.model.filter.AttributeFilter

```
class gooddata_sdk.compute.model.filter.AttributeFilter(label: Union[ObjId, str, Attribute], values: list[str] = None)
```

Bases: *Filter*

```
__init__(label: Union[ObjId, str, Attribute], values: list[str] = None) → None

gooddata_sdk.compute.service**Classes**

<code>ComputeService(api_client)</code>	Compute service drives computation of analytics for a GoodData.CN workspaces.
---	---

gooddata_sdk.compute.service.ComputeService

```
class gooddata_sdk.compute.service.ComputeService(api_client: GoodDataApiClient)
```

Bases: object

Compute service drives computation of analytics for a GoodData.CN workspaces. The prescription of what to compute is encapsulated by the ExecutionDefinition which consists of attributes, metrics, filters and definition of dimensions that influence how to organize the data in the result.

```
_init_(api_client: GoodDataApiClient)
```

Methods

`__init__(api_client)`

`for_exec_def(workspace_id, exec_def)` Starts computation in GoodData.CN workspace, using the provided execution definition.

`get_exec_metadata(workspace_id, result_id)` Gets execution result's metadata from GoodData.CN workspace for given execution result ID.

for_exec_def(*workspace_id*: str, *exec_def*: ExecutionDefinition) → *Execution*

Starts computation in GoodData.CN workspace, using the provided execution definition.

Parameters

- **workspace_id** – workspace identifier
- **exec_def** – execution definition - this prescribes what to calculate, how to place labels and metric values into dimensions

get_exec_metadata(*workspace_id*: str, *result_id*: str) → ResultCacheMetadata

Gets execution result's metadata from GoodData.CN workspace for given execution result ID.

Parameters

- **workspace_id** – workspace identifier
- **result_id** – execution result ID

Returns

execution result's metadata

3.1.4 gooddata_sdk.insight

Classes

`Insight`(from_vis_obj[, side_loads])

`InsightAttribute`(attribute)

`InsightBucket`(bucket)

`InsightFilter`(f)

`InsightMetric`(metric) Represents metric placed on an insight.

`InsightService`(api_client) Insight Service allows retrieval of insights from a GD.CN workspace.

gooddata_sdk.insight.Insight

```
class gooddata_sdk.insight.Insight(from_vis_obj: dict[str, Any], side_loads: Optional[SideLoads] = None)
```

Bases: object

```
__init__(from_vis_obj: dict[str, Any], side_loads: Optional[SideLoads] = None) → None
```

Methods

```
__init__(from_vis_obj[, side_loads])
```

```
get_metadata(id_obj)
```

Attributes

```
are_relations_valid
```

```
attributes
```

```
buckets
```

```
description
```

```
filters
```

```
id
```

```
metrics
```

```
properties
```

```
side_loads
```

```
sorts
```

```
title
```

```
vis_url
```

gooddata_sdk.insight.InsightAttribute

```
class gooddata_sdk.insight.InsightAttribute(attribute: dict[str, Any])
    Bases: object
    __init__(attribute: dict[str, Any]) → None
```

Methods

```
__init__(attribute)
```

```
as_computable()
```

Attributes

```
alias
```

```
label
```

```
label_id
```

```
local_id
```

gooddata_sdk.insight.InsightBucket

```
class gooddata_sdk.insight.InsightBucket(bucket: dict[str, Any])
    Bases: object
    __init__(bucket: dict[str, Any]) → None
```

Methods

```
__init__(bucket)
```

Attributes

```
attributes
```

```
items
```

```
local_id
```

```
metrics
```

gooddata_sdk.insight.InsightFilter

```
class gooddata_sdk.insight.InsightFilter(f: dict[str, Any])
    Bases: object
    __init__(f: dict[str, Any]) → None
```

Methods

`__init__(f)`

`as_computable()`**gooddata_sdk.insight.InsightMetric**

```
class gooddata_sdk.insight.InsightMetric(metric: dict[str, Any])
    Bases: object
    Represents metric placed on an insight.
    Note: this has different shape than object passed to execution.
    __init__(metric: dict[str, Any]) → None
```

Methods

`__init__(metric)`

`as_computable()`**Attributes**

`alias`

`format`

`is_time_comparison`

`item`

`item_id`

`local_id`

`time_comparison_master`

If this is a time comparison metric, return local_id of the master metric from which it is derived.

`title`

```
property time_comparison_master: Optional[str]
```

If this is a time comparison metric, return local_id of the master metric from which it is derived.

Returns

local_id of master metric, None if not a time comparison metric

gooddata_sdk.insight.InsightService

```
class gooddata_sdk.insight.InsightService(api_client: GoodDataApiClient)
```

Bases: object

Insight Service allows retrieval of insights from a GD.CN workspace. The insights are returned as instances of Insight which allows convenient introspection and necessary functions to convert the insight into a form where it can be sent for computation.

Note: the insights are created using GD.CN Analytical Designer or using GoodData.UI SDK. They are stored as visualization objects with a free-form body. This body is specific for AD & SDK. The Insight wrapper exists to take care of these discrepancies.

```
__init__(api_client: GoodDataApiClient) → None
```

Methods

```
__init__(api_client)
```

<code>get_insight(workspace_id, insight_id)</code>	Gets a single insight from a workspace.
<code>get_insights(workspace_id)</code>	Gets all insights for a workspace.

```
get_insight(workspace_id: str, insight_id: str) → Insight
```

Gets a single insight from a workspace.

Parameters

- **workspace_id** – identifier of workspace to load insight from
- **insight_id** – identifier of the insight

Returns

single insight; the insight will contain sideloaded metadata about the entities it references

Return type

Insight

```
get_insights(workspace_id: str) → list[Insight]
```

Gets all insights for a workspace. The insights will contain side loaded metadata for all execution entities that they reference.

Parameters

workspace_id – identifier of workspace to load insights from

Returns

all available insights, each insight will contain side loaded metadata about the entities it references

3.1.5 gooddata_sdk.sdk

Classes

<code>GoodDataSdk(client)</code>	Top-level class that wraps all the functionality together.
----------------------------------	--

gooddata_sdk.sdk.GoodDataSdk

`class gooddata_sdk.sdk.GoodDataSdk(client: GoodDataApiClient)`

Bases: `object`

Top-level class that wraps all the functionality together.

`__init__(client: GoodDataApiClient) → None`

Take instance of `GoodDataApiClient` and return new `GoodDataSdk` instance.

Useful when customized `GoodDataApiClient` is needed. Usually users should use `GoodDataSdk.create` classmethod.

Methods

<code>__init__(client)</code>	Take instance of <code>GoodDataApiClient</code> and return new <code>GoodDataSdk</code> instance.
<code>create(host_, token_[, extra_user_agent_])</code>	Create common <code>GoodDataApiClient</code> and return new <code>GoodDataSdk</code> instance.

Attributes

`catalog_data_source`

`catalog_organization`

`catalog_permission`

`catalog_user`

`catalog_workspace`

`catalog_workspace_content`

`client`

`compute`

`insights`

`support`

`tables`

```
classmethod create(host_: str, token_: str, extra_user_agent_: Optional[str] = None,
                   **custom_headers_: Optional[str]) → GoodDataSdk
```

Create common GoodDataApiClient and return new GoodDataSdk instance. Custom headers are filtered. Headers with None value are removed. It simplifies usage because headers can be created directly from optional values.

This is preferred way of creating GoodDataSdk, when no tweaks are needed.

3.1.6 gooddata_sdk.support

Classes

`SupportService(api_client)`

gooddata_sdk.support.SupportService

```
class gooddata_sdk.support.SupportService(api_client: GoodDataApiClient)
    Bases: object
    __init__(api_client: GoodDataApiClient) → None
```

Methods

`__init__(api_client)`

`wait_till_available(timeout[, sleep_time])` Wait till GD.CN service is available.

Attributes

`is_available` Checks if GD.CN is available.

`property is_available: bool`

Checks if GD.CN is available. Can raise exceptions in case of authentication or authorization failure.

Returns

True - available, False - not available

`wait_till_available(timeout: int, sleep_time: float = 2.0) → None`

Wait till GD.CN service is available. When timeout is:

- > 0 exception is raised after given number of seconds.
- = 0 exception is raised whe service is not available immediately
- < 0 no timeout

Method propagates is_available exceptions.

Parameters

- **timeout** – seconds to wait to service to be available (see method description for details)
- **sleep_time** – seconds to wait between GD.CN availability tests

3.1.7 gooddata_sdk.table

Classes

<code>ExecutionTable(response, first_page)</code>	Represents execution result as a table.
<code>TableService(api_client)</code>	The TableService provides a convenient way to drive computations and access the results in a tabular fashion.

gooddata_sdk.table.ExecutionTable

```
class gooddata_sdk.table.ExecutionTable(response: Execution, first_page: ExecutionResult)
Bases: object
```

Represents execution result as a table. This is a convenience wrapper for executions constructed using the following convention:

- all attributes are in the first dimension
- all metrics are in the second dimension
- if the execution is attribute- or metric-less, then there is always single dimension

The mapping to rows is then as follows:

- both attributes + metrics are on the execution = iteration over first dimension; as many rows as total records in the first dimension (`paging.total[0]`)
- just attributes = iteration over just headers in first dimension; as many rows as total records in the first dimension (`paging.total[0]`)
- just metrics = single row, all metrics values returned in one row

```
__init__(response: Execution, first_page: ExecutionResult) → None
```

Methods

```
__init__(response, first_page)
```

<code>read_all()</code>	Returns a generator that will be yielding execution result as rows.
-------------------------	---

Attributes

attributes

`column_ids`

Returns column identifiers.

`column_metadata`

Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column.

metrics

property `column_ids`: list[str]

Returns column identifiers. Each row will be a mapping of column identifier to column data.

property `column_metadata`: dict[str, Union[Attribute, Metric]]

Returns mapping of column identifier to definition of either attribute whose elements will be in that column or metric whose value will be calculated in that column.

`read_all()` → Generator[dict[str, Any], None, None]

Returns a generator that will be yielding execution result as rows. Each row is a dict() mapping column identifier to value of that column.

Returns

generator yielding dict() representing rows of the table

gooddata_sdk.table.TableService

class gooddata_sdk.table.TableService(api_client: GoodDataApiClient)

Bases: object

The TableService provides a convenient way to drive computations and access the results in a tabular fashion.

Compared to the ComputeService, with this one here you do not have to worry about the layout of the result and do not have to work with execution response, access the data using paging.

The ExecutionTable returned by the TableService allows you to iterate over the rows of the calculated data.

`__init__(api_client: GoodDataApiClient) → None`

Methods

`__init__(api_client)`

`for_insight(workspace_id, insight)`

`for_items(workspace_id, items[, filters])`

3.1.8 gooddata_sdk.type_converter

Functions

<code>build_stores()</code>	Initialize both AttributeConverterStore and DBTypeConverterStore with Convertors.
-----------------------------	---

gooddata_sdk.type_converter.build_stores

`gooddata_sdk.type_converter.build_stores() → None`

Initialize both AttributeConverterStore and DBTypeConverterStore with Convertors.

Classes

<code>AttributeConverterStore()</code>	Store for conversion of attributes
<code>Converter()</code>	Base Converter class.
<code>ConverterRegistryStore()</code>	Class store TypeConverterRegistry instances for each registered type.
<code>DBTypeConverterStore()</code>	Store for conversion of database types
<code>DateConverter()</code>	
<code>DatetimeConverter()</code>	
<code>IntegerConverter()</code>	
<code>StringConverter()</code>	
<code>TypeConverterRegistry(type_name)</code>	Class stores converters for given type with ability to distinguish converters based on sub-type granularity.

gooddata_sdk.type_converter.AttributeConverterStore

`class gooddata_sdk.type_converter.AttributeConverterStore`

Bases: `ConverterRegistryStore`

Store for conversion of attributes

`__init__()`

Methods

<code>__init__()</code>	
<code>find_converter(type_name[, sub_type])</code>	Find Converter for given type and sub type.
<code>register(type_name, class_converter[, sub_types])</code>	Register Converter instance created from provided Converter class to given type and list of sub types.
<code>reset()</code>	Reset converters setup

```
classmethod find_converter(type_name: str, sub_type: Optional[str] = None) → Converter
```

Find Converter for given type and sub type.

Parameters

- **type_name** – type name
- **sub_type** – sub type name

```
classmethod register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None
```

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type.

Parameters

- **type_name** – type name
- **class_converter** – Converter class
- **sub_types** – list of sub types or None (default type Converter)

```
classmethod reset() → None
```

Reset converters setup

gooddata_sdk.type_converter.Converter

```
class gooddata_sdk.type_converter.Converter
```

Bases: object

Base Converter class. It defines Converter API and implements support for external type conversion. External type conversion provides ability to plug-in conversion function to Converter

```
__init__()
```

Methods

```
__init__()
```

```
db_data_type()
```

```
set_external_fnc(fnc)
```

```
to_external_type(value)
```

```
to_type(value)
```

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.ConverterRegistryStore

class gooddata_sdk.type_converter.ConverterRegistryStore

Bases: object

Class store TypeConverterRegistry instances for each registered type. It provides interface to register converters with type and sub-type and to find converter. The class is not meant to be used directly but as base class for child classes

__init__()

Methods

__init__()

<code>find_converter(type_name[, sub_type])</code>	Find Converter for given type and sub type.
<code>register(type_name, class_converter[, sub_types])</code>	Register Converter instance created from provided Converter class to given type and list of sub types.
<code>reset()</code>	Reset converters setup

classmethod find_converter(type_name: str, sub_type: Optional[str] = None) → Converter

Find Converter for given type and sub type.

Parameters

- **type_name** – type name
- **sub_type** – sub type name

classmethod register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type.

Parameters

- **type_name** – type name
- **class_converter** – Converter class
- **sub_types** – list of sub types or None (default type Converter)

classmethod reset() → None

Reset converters setup

gooddata_sdk.type_converter.DBTypeConverterStore**class gooddata_sdk.type_converter.DBTypeConverterStore**Bases: *ConverterRegistryStore*

Store for conversion of database types

__init__()**Methods****__init__()**

<i>find_converter</i> (type_name[, sub_type])	Find Converter for given type and sub type.
<i>register</i> (type_name, class_converter[, sub_types])	Register Converter instance created from provided Converter class to given type and list of sub types.
<i>reset()</i>	Reset converters setup

classmethod find_converter(type_name: str, sub_type: Optional[str] = None) → Converter

Find Converter for given type and sub type.

Parameters

- **type_name** – type name
- **sub_type** – sub type name

classmethod register(type_name: str, class_converter: Type[Converter], sub_types: Optional[list[str]] = None) → None

Register Converter instance created from provided Converter class to given type and list of sub types. When sub types are not provided, converter is registered as the default one for given type.

Parameters

- **type_name** – type name
- **class_converter** – Converter class
- **sub_types** – list of sub types or None (default type Converter)

classmethod reset() → None

Reset converters setup

gooddata_sdk.type_converter.DateConverter**class gooddata_sdk.type_converter.DateConverter**Bases: *Converter***__init__()**

Methods

<code>__init__()</code>	
<code>db_data_type()</code>	
<code>set_external_fnc(fnc)</code>	
<code>to_date(value)</code>	Add first month and first date to incomplete iso date string.
<code>to_external_type(value)</code>	
<code>to_type(value)</code>	

Attributes

<code>DEFAULT_DB_DATA_TYPE</code>

classmethod `to_date(value: str) → date`

Add first month and first date to incomplete iso date string.

```
>>> assert DateConverter.to_date("2021-01") == date(2021, 1, 1)
>>> assert DateConverter.to_date("1992") == date(1992, 1, 1)
```

gooddata_sdk.type_converter.DatetimeConverter

`class gooddata_sdk.type_converter.DatetimeConverter`

Bases: `Converter`

`__init__()`

Methods

<code>__init__()</code>	
<code>db_data_type()</code>	
<code>set_external_fnc(fnc)</code>	
<code>to_datetime(value)</code>	Append minutes to incomplete datetime string.
<code>to_external_type(value)</code>	
<code>to_type(value)</code>	

Attributes

DEFAULT_DB_DATA_TYPE

classmethod `to_datetime`(*value: str*) → `datetime`

Append minutes to incomplete datetime string.

```
>>> from datetime import datetime
>>> assert DatetimeConverter.to_datetime("2021-01-01 02") == datetime(2021, 1, 1, 2, 0)
>>> assert DatetimeConverter.to_datetime("2021-01-01 12:34") == datetime(2021, 1, 1, 12, 34)
```

`gooddata_sdk.type_converter.IntegerConverter`

`class gooddata_sdk.type_converter.IntegerConverter`

Bases: `Converter`

`__init__()`

Methods

`__init__()`

`db_data_type()`

`set_external_fnc(fnc)`

`to_external_type(value)`

`to_type(value)`

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.StringConverter

```
class gooddata_sdk.type_converter.StringConverter
    Bases: Converter
    __init__()
```

Methods

__init__()
db_data_type()
set_external_fnc(fnc)
to_external_type(value)
to_type(value)

Attributes

DEFAULT_DB_DATA_TYPE

gooddata_sdk.type_converter.TypeConverterRegistry

```
class gooddata_sdk.type_converter.TypeConverterRegistry(type_name: str)
```

Bases: object

Class stores converters for given type with ability to distinguish converters based on sub-type granularity.

__init__(type_name: str)

Initialize instance with type for which instance is going to be responsible

Parameters

type_name – type name

Methods

__init__(type_name)	Initialize instance with type for which instance is going to be responsible
converter(sub_type)	Find and return converter instance for a given sub-type.
register(converter, sub_type)	Register converter instance for given sub-type (granularity).

converter(*sub_type*: *Optional[str]*) → *Converter*

Find and return converter instance for a given sub-type. Default converter instance is returned if the sub-type is not found or not provided. When a default converter is not registered, *ValueError* exception is raised.

Parameters

sub_type – sub-type name

Returns

Converter instance

register(*converter*: *Converter*, *sub_type*: *Optional[str]*) → *None*

Register converter instance for given sub-type (granularity). If sub-type is not specified, converter is registered as the default one for the whole type. Default converter can be registered only once.

Parameters

- **converter** – converter instance
- **sub_type** – sub-type name

3.1.9 gooddata_sdk.utils

Functions

camel_to_snake(*camel_case_str*)

change_case(*dictionary*, *case*)

change_case_helper(*value*, *case*)

create_directory(*path*)

get_sorted_yaml_files(*folder*)

id_obj_to_key(*id_obj*) Given an object containing an id+type pair, this function will return a string key.

load_all_entities(*get_page_func*[, *page_size*]) Loads all entities from a paged resource.

load_all_entities_dict(*get_page_func*[, ...])

read_layout_from_file(*path*)

snake_to_camel(*snake_case_str*)

write_layout_to_file(*path*, *content*)

gooddata_sdk.utils.camel_to_snakegooddata_sdk.utils.camel_to_snake(*camel_case_str*: str) → str**gooddata_sdk.utils.change_case**gooddata_sdk.utils.change_case(*dictionary*: dict, *case*: Callable[[str], str]) → dict**gooddata_sdk.utils.change_case_helper**gooddata_sdk.utils.change_case_helper(*value*: Union[list, dict, str], *case*: Callable[[str], str]) → Union[list, dict, str]**gooddata_sdk.utils.create_directory**gooddata_sdk.utils.create_directory(*path*: Path) → None**gooddata_sdk.utils.get_sorted_yaml_files**gooddata_sdk.utils.get_sorted_yaml_files(*folder*: Path) → list[Path]**gooddata_sdk.utils.id_obj_to_key**gooddata_sdk.utils.id_obj_to_key(*id_obj*: Union[str, ObjId, Dict[str, Dict[str, str]], Dict[str, str]]) → str

Given an object containing an id+type pair, this function will return a string key.

For convenience, this also recognizes the *ref* format used by GoodData.UI SDK. In that format, the id+type are wrapped in ‘identifier’.**Parameters****id_obj** – id object**Returns**

string that can be used as key

gooddata_sdk.utils.load_all_entitiesgooddata_sdk.utils.load_all_entities(*get_page_func*: functools.partial[Any], *page_size*: int = 500) → AllPagedEntities

Loads all entities from a paged resource. The primary input to this function is a partial function that is setup with all the fixed parameters. Given this the function will get entities page-by-page and merge them into a single ‘pseudo-response’ containing data and included attributes.

An example usage:

```
>>> import functools
>>> import gooddata_metadata_client as metadata_client
>>> import gooddata_metadata_client.apis as metadata_apis
>>> api = metadata_apis.EntitiesApi(metadata_client.ApiClient())
```

(continues on next page)

(continued from previous page)

```
>>> get_func = functools.partial(api.get_all_entities_visualization_objects, 'some-  
    ↪workspace-id',  
>>>                               include=['ALL'], _check_return_type=False)  
>>> vis_objects = load_all_entities(get_func)
```

Parameters

- **get_page_func** – an API controller from the metadata client
- **page_size** – optionally specify page length, default is 500

gooddata_sdk.utils.load_all_entities_dict

```
gooddata_sdk.utils.load_all_entities_dict(get_page_func: functools.partial[Any], page_size: int = 500,  
                                         camel_case: bool = False) → dict[str, Any]
```

gooddata_sdk.utils.read_layout_from_file

```
gooddata_sdk.utils.read_layout_from_file(path: Path) → Any
```

gooddata_sdk.utils.snake_to_camel

```
gooddata_sdk.utils.snake_to_camel(snake_case_str: str) → str
```

gooddata_sdk.utils.write_layout_to_file

```
gooddata_sdk.utils.write_layout_to_file(path: Path, content: Union[dict[str, Any], list[dict]]) → None
```

Classes

AllPagedEntities(data, included)

IndentDumper(stream[, default_style, ...])

SideLoads(objs)

gooddata_sdk.utils.AllPagedEntities

```
class gooddata_sdk.utils.AllPagedEntities(data, included)  
    Bases: tuple  
    __init__()
```

Methods

`__init__()`

<code>count(value, /)</code>	Return number of occurrences of value.
<code>index(value[, start, stop])</code>	Return first index of value.

Attributes

<code>data</code>	Alias for field number 0
<code>included</code>	Alias for field number 1

`count(value, /)`

Return number of occurrences of value.

property data

Alias for field number 0

property included

Alias for field number 1

`index(value, start=0, stop=9223372036854775807, /)`

Return first index of value.

Raises ValueError if the value is not present.

gooddata_sdk.utils.IndentDumper

```
class gooddata_sdk.utils.IndentDumper(stream, default_style=None, default_flow_style=False,
                                      canonical=None, indent=None, width=None,
                                      allow_unicode=None, line_break=None, encoding=None,
                                      explicit_start=None, explicit_end=None, version=None,
                                      tags=None, sort_keys=True)
```

Bases: SafeDumper

```
__init__(stream, default_style=None, default_flow_style=False, canonical=None, indent=None,
